We have undertaken a 6 week consultation on the draft Local Plan. Throughout the consultation period we held a number of drop-in sessions throughout the Borough, including in Marske, where people could discuss the Plan with Council officers. The consultation and drop-in events were advertised on the Council's website, resident's magazine and notification sent to those on our consultation database. The Council will also hold a 6 week consultation on the Publication draft of the Local Plan. Notification will be sent to those on our consultation database to inform them of the consultation, including anyone who has commented on the draft Local Plan. All of our consultation procedures are set out in the adopted Statement of Community Involvement. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The policy seeks to deliver a strategic housing site for up to approximately 1,000 dwellings, supporting community facilities, infrastructure and public open space. The Policy does not propose a hotel, pub/restaurant, drive-thru restaurant or petrol filling station. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be

required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place.

Comment summary:

The site is too big and out of keeping with the village character. There is not enough parking. The site will increase traffic. There is no demand for this amount of housing. There is not the required infrastructure to support the development. The site will impact on landscape character. The development will increase flood risk.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development

proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085.

Comment summary:

We would like to register our disapproval of the proposed developments of residential and commercial properties over the two sites at Long Beck and Windy Hill Farm. We chose to live in Marske because of the small community spirit, the surrounding greenery and views which the village is known for, not a town. We have already witnessed the development of the landings joining us to Redcar, this has taken away some of the history, and we don't want to lose what is remaining of a small village. This development will spoil a small fishing village as well as the small community which Marske by the sea is known for. The infrastructure will not support the explosion in population. This development will cause major congestion and traffic upheaval whilst the proposed works are in progress and after work is completed. The roads can't accommodate the traffic, especially on the proposed Windy Hill Farm project. Parking outside your own property will be impossible and very frustrating to the current residences as well as spoiling the coastal views. The houses will be out of character for this historic community. This development will impact on the wider community as the areas house prices will decline and insurance policies will increase due to the building on flood plains. Marske by the sea was recently affected by flooding, especially the properties that back onto the railway line. This will continue to be a problem with a development on the site. Building on a flood plain does not make sense when there is no further place for the water to hold as stated by Northumbrian Water. We do not want to see business' in the village square being damaged because of the hotel and petrol station. They are not needed. As regards to a drive through national statistics demonstrate that the population of the North East has the highest percentages of obesity and chronic illness the provision of a drive through take away in this area will encourage the problem to be compounded. This will have major financial implications on the National Health Service such as GP services in these times of financial austerity and scrutiny of every penny spent on public services. Our aim is to keep our green fields surrounding us which makes us a unique village!!

Officer response:

Only surplus brownfield land at Errington Primary School has been allocated for housing development on Windy Hill Lane under Policy H3.16. No greenfield sites have been allocated for development on Windy Hill Lane. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required to meet needs arising from the development. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The potential impact of the Local Plan on the loss of a view is not a material planning consideration and therefore cannot be taken into consideration in the preparation of the plan. The potential impact of the Local Plan on property values is not a material planning consideration and therefore cannot be taken into consideration in the preparation of the plan. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 4, which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the

probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. We do not need any more houses. We do not have the jobs or infrastructure to cope with this development. Why do planners always think change is for the better, this hasn't been the case as far as Redcar is concerned.

Officer response:

The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The Local Plan seeks to support economic growth and job creation. The plan also seeks to support the key industrial sectors of the port, chemicals, steel, and recycling industries whilst recognising the need to diversify the economy so that it is more resilient to change in the future. The plan also puts policies in place to support small and medium sized business as well as the tourism industry which has the potential for significant growth building upon the natural assets of the borough. House building is also a key economic sector, with housing development and economic growth intrinsically linked. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required to meet needs arising from the development.

DLP193**Full Name:** Stephen Durham**Organisation:****Agent Name:****Agent Organisation:****Submission type:** Other**Agree with section?:** No**Comment summary:**

Leave Marske under the East Cleveland section not Redcar conurbation! Priority should be given to development on previously developed land. Leave Marske greenfield/farmland for the environment benefit. Our identity is being eroded for the benefit of southern land owners!

Officer response:

The existing policy framework includes Marske within the conurbation. No changes are being proposed through the Local Plan. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement.

Comment summary:

It will lead to more flooding. My road already floods. More traffic. Loss of greenfield and wildlife. Road to New Marske impossible when flooded. No benefit to Marske residents at all. Marske will die. Where will these people work? Who will be able to afford these houses! New Marske will not benefit either.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or

viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. The Local Plan seeks to support economic growth and job creation. The plan also seeks to support the key industrial sectors of the port, chemicals, steel, and recycling industries whilst recognising the need to diversify the economy so that it is more resilient to change in the future. The plan also puts policies in place to support small and medium sized business as well as the tourism industry which has the potential for significant growth building upon the natural assets of the borough. House building is also a key economic sector, with housing development and economic growth intrinsically linked.

Comment summary:

The proposed development is not in keeping with the village of Marske and will alter it out of all recognition. The proposal submitted is very different from that consulted on during 2012. There is no need for an additional licensed premise or petrol station. There is inadequate pedestrian access from the new development to the existing village amenities, a totally new crossing of the railway would be required. The proposals for making a footpath under the existing railway bridge on the A1085 by installing traffic light controlled alternating traffic are, frankly, ridiculous. Such a move would cause considerable delays. There are proposals included for higher rise properties on the northern side of the development. Such properties would unduly overlook the existing housing on Sherwood Drive.

Officer response:

The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The policy seeks to deliver a strategic housing site for up to approximately 1,000 dwellings, supporting community facilities, infrastructure and public open space. The Policy does not propose a hotel, pub/restaurant, drive-thru restaurant or petrol filling station. The Council expects developers to carry out a genuine and meaningful consultation with local residents, interest groups and recommended/statutory consultees at an early stage, as set out within the Council's adopted Statement of Community Involvement. However, there is no legal obligation for a developer to undertake pre-application consultation and it can only be encouraged by the Council. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. The design of the proposals will be considered at the planning application stage.

Comment summary:

Why is another greenfield site being proposed for housing development? Have the council already extended development limits to include greenfield land around Marske? The population of the borough is in decline because there are no jobs. The DLP wants to promote "households with executive aspirations", but without a significant upturn in employment prospects in our region this is an unachievable aspiration. All talk of future jobs is in an aspirational context, with no firm plan and certainly no guarantee that any will be created. So they want to build houses in the hope that jobs will happen "somewhere, somehow". The council/developer have no option other than to use a Sustainable Urban Drainage System (SUDS), as Northumbrian Water (NW) have stated that no surface run-off water can be directed in to existing drains/culverts. The entire area is unsuitable for soil infiltration based SUDS due to the underlying geology, so this means the only solution is the on-site storage of water in huge tanks and then a controlled release, but to where? This is the same technique employed when the storage tanks were installed under The Stray. There have been several spill events this year and there has been a noticeable increase in frequency and duration. This has an associated effect on bathing water quality. Even NW is unable to design or verify the design of such systems to guarantee that the flood risk/run-off situation will not be worse in the future. Increased run-off water, in addition to the immediate areas, flooding will increase across large swathes of Marske, which is already highlighted to be at very high susceptibility to groundwater flooding by the British Geological Survey. The DLP refers to primary school capacity in both Marske and New Marske, and concedes that increased capacity will be required after 2018. The identified preferred option would be to build a new school on-site, but they appear to have ruled this out in favour of a financial contribution to education instead. Regarding secondary school capacity, information presented at the consultation event revealed that the council considers the catchment area to be borough wide. This might imply that future generations of Marske pupils may be expected to travel much further afield for secondary education.

Officer response:

The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The development limit boundaries are being reviewed as part of the process of updating the Local Plan. The proposed change to development limits around Marske is being consulted on as part of the consultation on the Local Plan. The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The Local Plan seeks to support economic growth and job creation. The plan also seeks to support the key industrial sectors of the port, chemicals, steel, and recycling industries whilst recognising the need to diversify the economy so that it is more resilient to change in the future. The plan also puts policies in place to support small and medium sized business as well as the tourism industry which has the potential for significant growth building upon the natural assets of the borough. House building is also a key economic sector, with housing development and economic growth intrinsically linked. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category "A", which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to

ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. The policy has identified that there will need to be a resolution of water supply, sewerage and drainage requirements including off-site infrastructure enhancements to allow the site to come forward for development. The Council will closely liaise with Northumbrian Water to ensure that the proposals are acceptable and would not result in an unacceptable impact upon water quality. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development.

Comment summary:

We wish to object in the strongest possible way to the granting of planning permission to build hundreds of houses on two sites in Marske. Not only will such a development completely destroy the character of the village but it would have a significant effect on traffic, causing congestion on already busy roads. As well as many other of the reasons for objecting to the proposed development, of which we are sure you are well aware, the one that is of most concern to us is the increased risk of flooding in the area. If so many more houses were built it would put even more strain on a system that cannot cope at present, as clearly illustrated by the floods of Sept 6th this year. We are still recovering from the damage that was done to our home on that day. As you are no doubt aware by the number of objections that you have received the people of Marske are very much against this proposal and as our elected representatives we sincerely hope that you will take heed of the wishes of those who live in the village.

Officer response:

The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. Comment summary:

I object vehemently to this Draft Local Plan it is outside local development limits. We at Marske don't want to be part of a conurbation of Redcar having lived all my life here at Marske it has a character of its own and we don't want that to change. Also I have neither seen nor heard of a consultation from the Council in the last seventy years that said we were to be part of a conurbation. Who do the Council think will possibly be able afford to live in four bedroomed houses when there is very little work now for people who need that sort of money to buy these houses or hadn't you noticed we don't have ICI and a thriving British Steel any longer. Perhaps you think workers at a petrol station on a minimum wage could afford executive housing. The DLP wants to promote "HOUSEHOLDS WITH EXECUTIVE ASPIRATIONS" Get real this is Marske. These evidenced based targets can be made to look correct but I am suggesting that Knights Franks are making Redcar and Borough Council dance to their tune. Don't you read your own stats there is a population decline here as many people move away to where there is better work prospects. There is a very weak housing market here, less houses are needed not more or is that too much common sense for Redcar Council to take in. We have still very much in our minds the flooding many people experienced here in Marske in September, still some homes are not back to normal even now. No matter what Northumbria Water or anyone else says Flooding will occur more frequently and houses that have been flooded will not be able to sell. No matter which water system these developers opt to use they would be gone when they have finished then who would be responsible the Council wouldn't want to know. How can a housing estate actually help biodiversity/geodiversity when it would be destroying our beautiful greenfields, perhaps you could actually email me with your answers on those two points alone. There are brownfield sites use them we just don't want to be left with just "green wedges" The idiotic idea that traffic lights at the Railway Bridge is crazy it would cause mayhem for the traffic flow through the High Street. When the builders had left with Half the infrastructure done would anyone care how it would be for the motorists buses lorries etc who use the High Street, certainly not the West Midland Police Fund nor Knight Franks I am certain. We don't want these houses nor do we need them and we will oppose this Draft local plan with every ounce of our being.

Officer response:

The development limit boundaries are being reviewed as part of the process of updating the Local Plan. The existing development limits boundary would be amended to include the site within development limits. The amendment to development limits formed part of the consultation on the Local Plan. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The existing policy framework includes Marske within the conurbation. No changes are being proposed through the Local Plan. The Local Plan seeks to support economic growth and job creation. The plan also seeks to support the key industrial sectors of the port, chemicals, steel, and recycling industries whilst recognising the need to diversify the economy so that it is more resilient to change in the future. The plan also puts policies in place to support small and medium sized business as well as the tourism industry which has the potential for significant growth building upon the natural assets of the borough. House building is also a key economic sector, with housing development and economic growth intrinsically linked. The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning

application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs.

Comment summary:

Once again we wish to lodge our strong objections to the above proposed development at Marske. We feel there are many reasons why we are objecting to this proposal. The draft local plan states that there is ample brownfield available for development, so why sacrifice a greenfield site for a housing development, which is what you are proposing, when it is needed as arable land. The recent flooding, from which we were victims, shows existing drains are not adequate to cope with the housing we have at present, how can a proposed 1000 houses not make this situation worse? Marske has always had its own character, and we are slowly losing this to urbanisation. Traffic congestion will be another problem with the increased housing, Marske High Street already has a large amount of traffic and further congestion will only cause problems for the emergency services. Where is the increased capacity for education as our existing schools are already becoming full? We sincerely trust that these objections will be addressed.

Officer response:

The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development.

Comment summary:

More specifically I now wish to raise points and objections to the housing development proposed for Marske. - Why is this development being proposed on a greenfield site when there are many brownfield sites available. It would be much more beneficial to the Borough to offer a decent architect a challenge to create something beautiful out of wasteland. In this country, agricultural land is at a premium and should be preserved and sustained to prevent the need to import even more food at increased cost to the population. Aesthetically, there is a fundamental need to retain this land to prevent the whole area from becoming totally urbanised. Although this is an ethical point, I believe that it should be given much greater consideration. - The area proposed for this development is certainly flooded with increased regularity and for this reason alone would be totally unsuitable for housing. The use of SUDS is entirely unsuitable method of soil infiltration due to the underlying geology of the area and to store water on site is not an option because there is no means of release into the existing drains. Northumbria Water has stated that no surface run-off water can be directed in existing drains and culverts so where will this excess water actually go ? - The problem of groundwater flooding that already exists in large areas of Marske would also increase as a result of this development resulting in more damage to existing properties as well as the proposed new housing. This Council has witnessed these problems in other areas of the Borough where people have been made homeless and without home insurances. Is it happy to see this type of misery spread to other areas ? - As the Council well knows, Marske already has traffic problems, but the problems this new development will create has the potential to increase traffic to an unacceptable level. Traffic along the High Street and Longbeck Road will become overwhelmingly dangerous and massively unmanageable. Pedestrians and cyclists will step onto the streets in Marske at their peril and speed humps, pinch points and traffic lights will not resolve these issues. - Where are all the children going to be educated ? The Council is to take the money offered towards another school instead of building one where it is needed! The schools in Marske do not have the spaces to accommodate many more children and it would be grossly unfair to expect children to be ferried to anywhere in the Borough that may have spaces regardless of the travelling distance involved. This Borough has enough urbanisation of its countryside, villages and towns and needs more appropriate development to improve its manufacturing base and employment record. Houses do not make jobs! Go back to the drawing board councillors and come up with a plan that will work, a plan that the people of the Borough want and a plan that has ethical and moral standing. Pie in the sky ideas will no longer do.

Officer response:

The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The site comprises of predominantly Grade 3b land within the Agricultural Land Classification, which is not considered to be the best and most versatile agricultural land. Whilst some of the site is considered to be Grade 3a, it is considered that the loss of these relatively small areas of higher quality agricultural land would be outweighed by the benefits of the development in helping to meet identified housing needs in a sustainable location. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access

and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development.

Comment summary:

I wish to object to this land being used for housing .This is greenfield land and feel there is alternative brownfield sites in the area that could be used for housing. Marske cannot retain its distinctive character when houses are being built nearer to New Marske .There will be increased traffic through Marske and congestion at the railway bridge due to the narrow road ..There could be safety issues for children travelling to secondary school (Bydales) if they have to use this road as access. There is also the problem of flooding that occurred a few weeks ago .The impact of increased run off water could impact on houses in the Sherwood drive area and other areas of marske.

Officer response:

The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Can you please provide me the list of existing local employers who have committed to creating the jobs in this area that would necessitate that level of housing increase in our area? Or the list of companies which are planning to move in to the area bringing jobs? As I see many for sale signs on houses all over the area, and current housing developments progressing very slowly, I do not see the housing demand and therefore see no need for this plan.

Officer response:

The Local Plan seeks to support economic growth and job creation. The plan also seeks to support the key industrial sectors of the port, chemicals, steel, and recycling industries whilst recognising the need to diversify the economy so that it is more resilient to change in the future. The plan also puts policies in place to support small and medium sized business as well as the tourism industry which has the potential for significant growth building upon the natural assets of the borough. House building is also a key economic sector, with housing development and economic growth intrinsically linked. The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy.

Comment summary:

We are responding to object to the houses campaign we came to Marske 25 years ago from Harrogate to live in a village away from all the hustle and bustle, the calm country side at the end of our street is very therapeutic. If you were to build a site all this will cause lots of traffic, more congestion in schools as we know from experience. My granddaughter could not get in to the local school but now has to travel to the Ings farm. There has also been whispers that you would be rehousing the people from other areas. We feel this could cause more trouble in the area if this was to be true. The people who live on Howard drive have had a beautiful scenic view and now all they are going to look at is a building site, which is going to cause lots of disruption, that brings me to the one lane on Marske High St. It is a long way from the emergency services to get to Marske anyway but to restrict them any more would be absolutely ridiculous. We strongly object to the whole project.

Officer response:

This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The site is being provided to meet identified housing needs, predominantly arising from existing residents of the borough. The potential impact of the Local Plan on the loss of a view is not a material planning consideration and therefore cannot be taken into consideration in the preparation of the plan.

Comment summary:

I wish to object to the proposal in your draft local plan to develop land at Marske Inn Farm. I think it a very bad plan for various reasons I'd like us to maintain the distinctive character of Marske rather than it become part of a conurbation. I'd therefore like us to maintain the greenfield gap between Marske and N.Marske and Saltburn. The quality of our surroundings is important to us. I would anyway have doubts as to whether more housing is needed in the area, with population declining; continuing high unemployment etc Also concerns about drainage and possible flooding resulting from the plans. Please think again.

Officer response:

The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The existing policy framework includes Marske within the conurbation. No changes are being proposed through the Local Plan. Whilst it is recognised that the proposals would result in a narrowing of the strategic gap between Marske and New Marske, the policy indicates that a deep planting buffer will be provided towards the A174, which will help to reinforce the strategic gap and retain its integrity. The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. Comment summary:

We wish to object in the strongest possible way to the granting of planning permission to build hundreds of houses on two sites in Marske. Not only will such a development completely destroy the character of the village but it would have a significant effect on traffic, causing congestion on already busy roads. As well as many other of the reasons for objecting to the proposed development, of which we are sure you are well aware, the one that is of most concern to us is the increased risk of flooding in the area. If so many more houses were built it would put even more strain on a system that cannot cope at present, as clearly illustrated by the floods of Sept 6th this year. We are still recovering from the damage that was done to our home on that day. As you are no doubt aware by the number of objections that you have received the people of Marske are very much against this proposal and as our elected representatives we sincerely hope that you will take heed of the wishes of those who live in the village.

Officer response:

The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. Comment summary:

I must register my protest against the proposed housing development for the area south of the railway at Marske . I do not know the ages of the Councillors making the final decision but I would imagine (given the timescale for the plan) that most of them would not be around to suffer the consequences if the building goes ahead . This plan would leave future generations of an unalterable legacy of flooding , innadequate infrastructure, insufficient drainage and sewage disposal , not enough schools, doctors and dentists . All this and for what ; a fist full of fools gold in exchange for the ruination of the village as we know it . Marske will be swallowed up in some great sprawling heartless concrete abomination with at it's center, I hope , will be a huge sign listing all the names of the councillors that inflicted this hideous monstrosity on this peacefull oasis of a village . A life - long Marske resident.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. I am writing to object to your latest draft local plan for Marske. You seem to think that there is a need for more houses when there is nothing to indicate this. There are plenty of houses for sale and no new businesses to suggest an influx of new workers. There are brownfield sites which would be more sustainable than using fields needed for growing crops, growing crops also lessens the possibility of flooding, a feature at present which occurs frequently anyway with heavy downpours.

Officer response:

The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The Local Plan seeks to support economic growth and job creation. The plan also seeks to support the key industrial sectors of the port, chemicals, steel, and recycling industries whilst recognising the need to diversify the economy so that it is more resilient to change in the future. The plan also puts policies in place to support small and medium sized business as well as the tourism industry which has the potential for significant growth building upon the natural assets of the borough. House building is also a key economic sector, with housing development and economic growth intrinsically linked. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The site comprises of predominantly Grade 3b land within the Agricultural Land Classification, which is not considered to be the best and most versatile agricultural land. Whilst some of the site is considered to be Grade 3a, it is considered that the loss of these relatively small areas of higher quality agricultural land would be outweighed by the benefits of the development in helping to meet identified housing needs in a sustainable location.

Comment summary:

I strongly object to the proposed development in Marske for the many reasons but mainly for Greenfield Versus Brownfield Sites, Development Limits, Identity and Strategic Gap The DLP states that there is a good supply of brownfield land. Why is another greenfield site being proposed for housing development? Loss of highly productive arable land in times of escalating food prices. Have the council already extended development limits to include greenfield land around Marske? If so, how was this passed without extensive consultation with residents? How / when did Marske become classed as part of the 'conurbation'? The DLP states that 'Marske has always maintained its own distinctive character'. It is clear that Marske is one of the many coastal / rural villages that characterise East Cleveland. Why is the plan intent on destroying this character? The DLP also claims that 'a deep planting buffer towards the A174 reinforces the strategic gap to New Marske'. Surely the best form of strategic gap is one that isn't reduced to just a few hundred yards, as the council has already allowed to happen between Marske and Redcar. How can Marske and East Cleveland in general maintain its own distinctive character when the council is intent on absorbing it in to their vast urban sprawl?

Officer response:

The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The development limit boundaries are being reviewed as part of the process of updating the Local Plan. The existing development limits boundary would be amended to include the site within development limits. The amendment to development limits formed part of the consultation on the Local Plan. Whilst it is recognised that the proposals would result in a narrowing of the strategic gap between Marske and New Marske, the policy indicates that a deep planting buffer will be provided towards the A174, which will help to reinforce the strategic gap and retain its integrity. The site comprises of predominantly Grade 3b land within the Agricultural Land Classification, which is not considered to be the best and most versatile agricultural land. Whilst some of the site is considered to be Grade 3a, it is considered that the loss of these relatively small areas of higher quality agricultural land would be outweighed by the benefits of the development in helping to meet identified housing needs in a sustainable location. The existing policy framework includes Marske within the conurbation. No changes are being proposed through the Local Plan.

Officer response:

The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The development limit boundaries are being reviewed as part of the process of updating the Local Plan. The existing development limits boundary would be amended to include the site within development limits. The amendment to development limits formed part of the consultation on the Local Plan. Whilst it is recognised that the proposals would result in a narrowing of the strategic gap between Marske and New Marske, the policy indicates that a deep planting buffer will be provided towards the A174, which will help to reinforce the strategic gap and retain its integrity. The site comprises of predominantly Grade 3b land within the Agricultural Land Classification, which is not considered to be the best and most versatile agricultural land. Whilst some of the site is considered to be Grade 3a, it is considered that the loss of these relatively small areas of higher quality agricultural land would be outweighed by the benefits of the development in helping to meet identified housing needs in a sustainable location. The existing policy framework includes Marske within the conurbation. No changes are being proposed through the Local Plan.

Comment summary:

The plan would exacerbate existing problems. Traffic congestion is already bad, with only a single carriageway through to East Cleveland. It is presumed that public transport and sustainable transport such as cycling would be improved, however there is an increasing dependence on the car and therefore congestion will be increased. There are already existing flooding problems in Marske, which would be made worse by the development. Northumbrian Water have indicated that additional water could not be discharged into the existing system and that storage tanks would be required. Not convinced by the effectiveness of storage tanks. There are no proposals to improve existing services, therefore existing services will be put at risk. There is high unemployment in the area and local industries are declining. There needs to be sustainable employment before new houses. Brownfield sites should be developed before greenfield sites. There is no need for this level of housing in Marske.

Officer response:

This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required to meet needs arising from the development. The Local Plan seeks to support economic growth and job creation. The plan also seeks to support the key industrial sectors of the port, chemicals, steel, and recycling

industries whilst recognising the need to diversify the economy so that it is more resilient to change in the future. The plan also puts policies in place to support small and medium sized business as well as the tourism industry which has the potential for significant growth building upon the natural assets of the borough. House building is also a key economic sector, with housing development and economic growth intrinsically linked. The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs.

Comment summary:

There are a number of houses for sale in the Marske area. Marske is in an area of flood risk. The development does not reclaim and reuse derelict land. Development in this location would not allow people to live closer to their place of work, shops and services. It is likely to add to the congestion. The distinctive character of Marske would be compromised. Need jobs to attract the economically active to live in the Borough.

Officer response:

The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The Council has prioritised development on the most sustainable sites to meet identified housing needs, whilst ensuring that sites are viable for residential development and have a realistic prospect of being delivered within the plan period. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. buy these new houses. New jobs should be created first before houses are built. The Local Plan seeks to support economic growth and job creation. The plan also seeks to support the key industrial sectors of the port, chemicals, steel, and recycling industries whilst recognising the need to diversify the economy so that it is more resilient to change in the future. The plan also puts policies in place to support small and medium sized business as well as the tourism industry which has the potential for significant growth building upon the natural assets of the borough. House building is also a key economic sector, with housing development and economic growth intrinsically linked.

Comment summary:

We should like to register our objection to the Council's Draft Local Plan. Our grounds for objection are listed below. - Housing: You state that 'There are areas in the Borough with high demand for housing supporting high price range properties. These contrast with areas of virtual market collapse, poor conditions and dereliction. Significant parts of the local market are characterised by obsolete and outdated housing, originally built to provide homes to support an industrial infrastructure that no longer exists. Much of the stock fails to meet the Government's decency standard, and does not meet people's aspirations'. Clearly none of this applies to Marske. On RightMove alone recently there were 533 houses for sale within a one mile radius of TS11. - Policy CS1. Securing a Better Quality of Life. 3.2. You highlight these two points. 'Controlling development in areas at risk of flooding'. Marske is clearly in an area of flood risk. Please refer to the British Geological Survey Groundwater Flood Risk Susceptibility Map for the area. 'Reclaiming and reusing derelict land'. This development does not meet these conditions. - You state 'Greenfield land may need to be released over the plan period in and around the urban areas to meet the housing requirements.' It is not clear how this condition is met here. You also state 'More new housing in the urban area would mean people have the potential to live closer to their place of work, shops and services. This would mean a reduced need to travel long distances, stabilising traffic levels and congestion in the Borough'. Clearly this condition is not met here and it is likely to add to the congestion you refer to in the section on Transport. - You state 'Marske has always maintained its own distinctive character'. This would be completely compromised by your Housing Plan, not just to the detriment of Marske, but to the detriment of the whole of East Cleveland. - You state that 'Attracting the economically active to live in the Borough will have helped to reverse the trend of population decline and contributed to establishing an adaptable and more diverse well-skilled work force'. This only applies if the 'economically active' have jobs to go to. We should be grateful if you would record this objection.

Officer response:

The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. It is an inevitable consequence of development that the proposals will result in additional traffic. However, the Council has sought to minimise this by locating sites in the most sustainable locations with good access to public transport and close to services and facilities to minimise the need to travel and the distance travelled. It is considered that the site is located in a sustainable location adjacent to two railway

stations on the Saltburn to Darlington line and in relative close proximity to a range shops, services and community facilities. Policy TA2 also includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The Council has prioritised development on the most sustainable sites to meet identified housing needs, whilst ensuring that sites are viable for residential development and have a realistic prospect of being delivered within the plan period. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. Policy TA2 also includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport.

Comment summary:

Object to the proposed development of Marske Inn Farm site, is a folly to build homes with out the structure to support growth such as School and Doctors, also where are the jobs to support the growth more housing brings? Should we be building on valuable Farming green sites? I do not think the Council has taken into consideration the wishes of the local people of Marske who see they Village Being swallowed up by Development which seem to be driven by profit alone.

Officer response:

The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required to meet needs arising from the development. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The Local Plan seeks to support economic growth and job creation. The plan also seeks to support the key industrial sectors of the port, chemicals, steel, and recycling industries whilst recognising the need to diversify the economy so that it is more resilient to change in the future. The plan also puts policies in place to support small and medium sized business as well as the tourism industry which has the potential for significant growth building upon the natural assets of the borough. House building is also a key economic sector, with housing development and economic growth intrinsically linked. The site comprises of predominantly Grade 3b land within the Agricultural Land Classification, which is not considered to be the best and most versatile agricultural land. Whilst some of the site is considered to be Grade 3a, it is considered that the loss of these relatively small areas of higher quality agricultural land would be outweighed by the benefits of the development in helping to meet identified housing needs in a sustainable location. Comment summary:

Strongly object to the proposals for the development of 1000 houses / hotel / drive through food outlet & pub all of which is not necessary and surely against the wishes of Marske village residents. It is obvious that the root reason for the development is monetary gain and not the need for housing requirements (which I am sure is not affordable housing). As I have been involved in construction and engineering projects over many years I cannot understand that residents have not been notified as to the detrimental effects of this considerable construction project - most importantly what work is to be done to ensure adequate drainage for the whole area involved as this could have dire consequences to my home and many more homes on the adjoining estate north of the railway track. The people who are promoting this development within Redcar and Cleveland Borough Council should be ashamed as they are not truly representing or taking note of the feelings and concerns of local people.

Officer response:

The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The policy seeks to deliver a strategic housing site for up to approximately 1,000 dwellings, supporting community facilities, infrastructure and public open space. The Policy does not propose a hotel, pub/restaurant, drive-thru restaurant or petrol filling station. The Council expects developers to carry out a genuine and meaningful consultation with local residents, interest groups and recommended/statutory consultees at an early stage, as set out within the Council's adopted Statement of Community Involvement. However, there is no legal obligation for a developer to undertake pre-application consultation and it can only be encouraged by the Council. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place.

Comment summary:

The planned development at Marske would exacerbate traffic problems related to car-borne committing. There will be an unacceptable increase in traffic particularly along Marske High Street and Longbeck Road with significant increase in congestion at the railway bridge, possibly leading to delay for emergency vehicles. There will be increased flood risk, no surface water run-off can be directed into the existing drainage system and soil type is not suitable for soil infiltration based SUDS. If the solution to this is to store water in on-site tanks with a controlled release, where will it be released to? Has been issues with this technique at the Stray. There are other objections in relation to greenfield versus brownfield sites, development limits, identity and education.

Officer response:

This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. The policy has identified that there will need to be a resolution of water supply, sewerage and drainage requirements including off-site infrastructure enhancements to allow

the site to come forward for development. The Council will closely liaise with Northumbrian Water to ensure that the proposals are acceptable and would not result in an unacceptable impact upon water quality. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The development limit boundaries are being reviewed as part of the process of updating the Local Plan. The existing development limits boundary would be amended to include the site within development limits. The amendment to development limits formed part of the consultation on the Local Plan. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development.

Comment summary:

As a resident of Marske, I feel it totally unnecessary to build 1000 new houses, hotel etc on greenbelt land. At the present time there are over 500 houses for sale in the TS11 postcode area - there are no jobs available in the area. Development of this size will create enormous pressure on the infrastructure and depress the area. The risk of flooding will be greatly increased because of the development. The council should rethink their ideas.

Officer response:

The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The Local Plan seeks to support economic growth and job creation. The plan also seeks to support the key industrial sectors of the port, chemicals, steel, and recycling industries whilst recognising the need to diversify the economy so that it is more resilient to change in the future. The plan also puts policies in place to support small and medium sized business as well as the tourism industry which has the potential for significant growth building upon the natural assets of the borough. House building is also a key economic sector, with housing development and economic growth intrinsically linked. There is no green belt designation within Redcar and Cleveland. However, the Local Plan protects green and open spaces as identified on the proposals map and protects the rural area through the establishment of development limits surrounding the main settlements. The space between Marske and New Marske is designated as a strategic gap between the conurbation and rural area under Policy N2. Whilst it is recognised that the proposals would result in a narrowing of the strategic gap between Marske and New Marske, the policy indicates that a deep planting buffer will be provided along the A174, which will help to reinforce the strategic gap and retain its integrity. Accessible open space will also be required as part of the development in accordance with Policy N3. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required to meet needs arising from the development. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all

forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Comment summary:

I wish to object to the proposed development plans at Marske. A development of this size and type is completely out of context with present day Marske, which would destroy the community and fabric as it stands. The village has limited parking space and no land to develop for this purpose. Flooding has always been a problem, whether it be in the town centre or at Longbeck crossing, as was highlighted in September. An influx of numbers would put pressure on doctors surgeries and schools, increasing the numbers in each class. The Marske bypass is already a busy throughroute throughout the day, a development like this would add to congestion, not only to this road but within Marske centre and would certainly increase levels of concern regarding safety. The infrastructures are not in place to support this development. You are in danger of losing a villages individual identity by creating an urban sprawl.

Officer response:

The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. Contributions will be required, as necessary, at the time of the application towards any infrastructure requirement, including car parking to meet needs arising from the development. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore,

the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085.

Being born and bred in Marske (now 73), I feel very strongly about your plans. What bit of green space we have left, you are taking. I have recently been the victim of the fields flooding which affected me very much. People are dubious about buying our houses because of the trains but eventually over look it for the view, take that away and we have no chance. There must be 1,000 houses for sale now so what chance of selling 1,000 more. Probably in prep for the refugees next year and feel very strong about this. No longer the village I loved.

Officer response:

The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. Accessible open space will also be required as part of the development in accordance with Policy N3. The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The potential impact of the Local Plan on the loss of a view is not a material planning consideration and therefore cannot be taken into consideration in the preparation of the plan.

Comment summary:

As a Marske by the Sea resident I am really concerned about the increased risk of flooding in the village if the new developments go ahead. I understand that it's proposed to build an underground holding chamber that will gradually release the water if there is a downpour. There is no guarantee that it will be able to cope. There were underground storage tanks at St. Josephs Court Redcar and look what happened there.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. Comment summary:

I am writing to express my concern at the proposals to build on the farmland around Marske. Amongst other things, the loss of this farmland would result in increased incidence of flooding. Residents of Marske experienced this in September . I have attached photographs of a friend's house on Hawkins Close - an area very near one of the sites earmarked for building at Howard Drive. It would also put extra pressure on a sewerage system that is struggling to cope with the existing population's use. The roads in Marske are already very busy and often suffer congestion. Increased pressure on them would undoubtedly increase the potential for road traffic accidents.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. The policy already requires the resolution of water supply, sewerage and drainage requirements including off-site infrastructure enhancements, prior to development taking place. It is an inevitable consequence of development that the proposals will result in additional traffic. However, the Council has sought to minimise this by locating sites in the most sustainable locations with good access to public transport and close to services and facilities to minimise the need to travel and the distance travelled. It is considered that the site is located in a sustainable location adjacent to two railway stations on the Saltburn to Darlington line and in relative close proximity to a range shops, services and community facilities. Policy TA2 also includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport.

DLP119**Full Name:** Gillian Walker**Organisation:****Agent Name:****Agent Organisation:****Submission type:** Letter**Agree with section?:** No**Comment summary:**

There is no demand for this amount of housing. The site is outside development limits. Brownfield sites should be selected first. The site is too big and out of keeping with the existing character of Marske. The plan should recognise current economic restraints. It should focus on existing communities and strengths and should engage individual local communities to meet their specific needs.

Officer response:

The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The development limit boundaries are being reviewed as part of the process of updating the Local Plan. The existing development limits boundary would be amended to include the site within development limits. The amendment to development limits formed part of the consultation on the Local Plan. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. Comment summary:

Strongly object to the proposals for the development of 1000 houses / hotel / drive through food outlet & pub all of which is not necessary and surely against the wishes of Marske village residents. It is obvious that the root reason for the development is monetary gain and not the need for housing requirements (which I am sure is not affordable housing). As I have been involved in construction and engineering projects over many years I cannot understand that residents have not been notified as to the detrimental effects of this considerable construction project - most importantly what work is to be done to ensure adequate drainage for the whole area involved as this could have dire consequences to my home and many more homes on the adjoining estate north of the railway track. The people who are promoting this development within Redcar and Cleveland Borough Council should be ashamed as they are not truly representing or taking note of the feelings and concerns of local people.

Officer response:

The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The policy seeks to deliver a strategic housing site for up to approximately 1,000 dwellings, supporting community facilities, infrastructure and public open space. The Policy does not propose a hotel, pub/restaurant, drive-thru restaurant or petrol filling station. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Comment summary:

Please note that I wish to register my objection to the Redcar and Cleveland plan, building a new housing estate etc at Marske turning virgin greenfield land into a ugly concrete urban sprawl for ever. This is wanton destruction and also unnecessary. I also object to exposing our citizens to the risk of flooding and vastly increased traffic, this will put pedestrians, cyclists and people pursuing other leisure pursuits in direct conflict and danger from motorists who seem to dominate our society these days, thanks to short sighted and unsustainable planning like this.

Officer response:

The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. Comment summary:

Leave farmland as it is. I do not believe there is a need to build on this land which is likely to create problems with increased traffic and carbon emissions. The area has a propensity to flood and this can only be increased by more hard surfacing of the land and the councils ability to get to grips with existing flooding leaves a lot to be desired. I am also concerned with the loss of food producing land as well as the visual impact of the proposal. The plan also states the population is declining, which I consider a desirable state of affairs, but which suggests we should reduce the amount of housing not increase it.

Officer response:

The site comprises of predominantly Grade 3b land within the Agricultural Land Classification, which is not considered to be the best and most versatile agricultural land. Whilst some of the site is considered to be Grade 3a, it is considered that the loss of these relatively small areas of higher quality agricultural land would be outweighed by the benefits of the development in helping to meet identified housing needs in a sustainable location. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. Comment summary:

Object to the proposed development. The proposals are significantly different to those that were consulted on in 2012 and the additional proposals (60 bed motel and fast food drive-through restaurant etc) would be of no benefit to Marske residents. Concerns over the potential increase in already established flood risk. Not confident that Northumbrian Water's proposals will address the issue due to recent flooding at Mersey Road area of Redcar. If the development goes ahead there should be stricter strategies to deal with flood risk. Concerns over school provision. Believe that the Council has opted for a financial contribution rather than a new school. Not clear where this money will be spent. The proposals would require greatly improved infrastructure. Also development should not be supported between Marske and Saltburn as it would destroy the identity of both settlements.

Officer response:

The policy seeks to deliver a strategic housing site for up to approximately 1,000 dwellings, supporting community facilities, infrastructure and public open space. The Policy does not propose a hotel, pub/restaurant, drive-thru restaurant or petrol filling station. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. Whilst it is recognised that the proposals would result in a narrowing of the strategic gap between Marske and New Marske, the policy indicates that a deep planting buffer will be provided towards the A174, which will help to reinforce the strategic gap and retain its integrity.

There is no need for a hotel in Marske. The proposals would result in extra traffic. Concerns over flooding. There is no need for more housing in Marske. Local people don't want this development.

Officer response:

The policy seeks to deliver a strategic housing site for up to approximately 1,000 dwellings, supporting community facilities, infrastructure and public open space. The Policy does not propose a hotel, pub/restaurant, drive-thru restaurant or petrol filling station. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the

drainage issues on the site and indicates that these must be resolved to enable the development to take place. The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy.

DLP8**Full Name:** Mr P Finlinson**Organisation:****Agent Name:****Agent Organisation:****Submission type:** E-Mail**Agree with section?:** No

Comment summary:

Objects to the proposed housing allocation. The local residents do not want to see 1,000 new houses built on their doorstep. The existing services do not cope at present and new building will make this situation worse. The plan should be subject to a borough wide referendum before being adopted.

Officer response:

The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required to meet needs arising from the development.

Section/Policy**Policy H 3.1****Marske Inn Farm Strategic Site**

DLP7**Full Name:** Peter Harker**Organisation:****Agent Name:****Agent Organisation:****Submission type:** Letter**Agree with section?:** No**Comment summary:**

Object to the proposed allocation. The proposals would be of minimum benefit to the local economy. The roads are already at capacity and there is a lack of schooling and doctors. A further pub, hotel and petrol filling station are not needed. There are ample inner city sites available in Redcar for major development for lower cost homes which are needed. Development here would damage views of the Errington Woods.

Officer response:

This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required to meet needs arising from the development. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The potential impact of the Local Plan on the loss of a view is not a material planning consideration and therefore cannot be taken into consideration in the preparation of the plan.

DLP5**Full Name:** Eric Foster**Organisation:****Agent Name:****Agent Organisation:****Submission type:** E-Mail**Agree with section?:** No**Comment summary:**

Would not like to see the site developed as this would be of no benefit to local people.

Officer response:

The Local Plan seeks to support economic growth and job creation alongside providing an adequate supply of housing to meet identified needs. House building is a key economic sector, with housing development and economic growth intrinsically linked.

Comment summary:

The developments around Marske are outside the development limits. We do not want this plan pushed through by it being included in the Draft Local Plan. I read that it states local people support the plan. I have not found anyone speaking in support of it who lives here in Marske. People do not want to see the VILLAGE becoming more sprawled. There are already issues with drainage due to land being built upon and probably due also to climate change which is not going to get any better anytime soon. I strongly object to the way this is being pushed through regardless of peoples opinions.

Officer response:

The development limit boundaries are being reviewed as part of the process of updating the Local Plan. The existing development limits boundary would be amended to include the site within development limits. The amendment to development limits formed part of the consultation on the Local Plan. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flood paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place.

Comment summary:

Object to the proposals. The site is prone to surface water flooding and the proposals would exacerbate this problem. Increased traffic congestion. Increased pressure on local services and infrastructure, including local schools and health centres. There has been insufficient consultation on the proposals. The site is arable land which could be home to wildlife and birdlife. The area has already been over-developed and the development would ruin the character of this traditional North Yorkshire fishing village.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required

to meet needs arising from the development. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The Council expects developers to carry out a genuine and meaningful consultation with local residents, interest groups and recommended/statutory consultees at an early stage, as set out within the Council's adopted Statement of Community Involvement. However, there is no legal obligation for a developer to undertake pre-application consultation and it can only be encouraged by the Council. We have undertaken a 6 week consultation on the draft Local Plan. Throughout the consultation period we held a number of drop-in sessions throughout the Borough, including in Marske, where people could discuss the Plan with Council officers. The consultation and drop-in events were advertised on the Council's website, resident's magazine and notification sent to those on our consultation database. The Council will also hold a 6 week consultation on the Publication draft of the Local Plan. Notification will be sent to those on our consultation database to inform them of the consultation, including anyone who has commented on the draft Local Plan. All of our consultation procedures are set out in the adopted Statement of Community Involvement. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. The policy seeks to deliver a strategic housing site for up to approximately 1,000 dwellings, supporting community facilities, infrastructure and public open space. The Policy does not propose a hotel, pub/restaurant, drive-through restaurant or petrol filling station. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs.

Comment summary:

I am writing to express my concern at the proposals to build on the farmland around Marske. Amongst other things, the loss of this farmland would result in increased incidence of flooding. Residents of Marske experienced this in September . I have attached photographs of a friend's house on Hawkins Close - an area very near one of the sites earmarked for building at Howard Drive. It would also put extra pressure on a sewerage system that is struggling to cope with the existing population's use. The roads in Marske are already very busy and often suffer congestion. Increased pressure on them would undoubtedly increase the potential for road traffic accidents.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. The policy already requires the resolution of water supply, sewerage and drainage requirements including off-site infrastructure enhancements, prior to development taking place. It is an inevitable consequence of development that the proposals will result in additional traffic. However, the Council has sought to minimise this by locating sites in the most sustainable locations with good access to public transport and close to services and facilities to minimise the need to travel and the distance travelled. It is considered that the site is located in a sustainable location adjacent to two railway stations on the Saltburn to Darlington line and in relative close proximity to a range shops, services and community facilities. Policy TA2 also includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport.

Comment summary:

I wish to protest, in the strongest possible terms, at the proposed housing development to the south of Marske by the Sea for a number of reasons, many of which I am quite sure you are already aware. a) drainage - NWA will not improve the drainage should this development go ahead. This would cause extremely serious problems for existing homes. b) schooling - Marske schools, especially primary schools are already full. Where would you expect to place future children caused by this expansion. c) greenfield v brownfield - there must be far more and better sites for development in the area. Leave the greenfield sites well alone. d) population - if anything, the population seems to be shrinking. Where would the new inhabitants come from. I see no reason for this expansion. e) congestion - only some over-paid, under-worked, brain-dead council planner could think having one-way traffic lights at the railway bridge, close to this possible development. It would bring absolute chaos to an already busy thoroughfare. I am quite certain there are other points against this proposed project, but I would respectfully request you give the above your consideration.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. The policy indicates that the proposals will be expected to provide a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking account the impact of the development on the landscape. In addition, the policy requires a landscape assessment and appropriate landscaping scheme throughout the site, including a deep planting buffer towards the A174 which reinforces the strategic gap with New Marske. Detailed consideration of the impact of the proposals upon the natural environment will be made as part of the planning application process. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The Council has

prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. Accessible open space will also be required as part of the development in accordance with Policy N3. The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085.

Comment summary:

We are writing to object to any further development at Marske. In the forty years we have lived here Marske has slowly grown because of re-development over this time. This has brought more traffic through the village in spite of the by-pass, any new developments will cause more congestion on roads in and out of Marske. Because of the recent flooding and the fact that the drains/culverts were unable to cope with the excess water, any further developments will only increase the problem of the flooding in the Marske area. Any further development around Marske is going to take away greenfield sites and we will lose the character of Marske as a village.

Officer response:

This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. Comment summary:

Marske is clearly in an area of flood risk. Please refer to the British Geological Survey Groundwater Flood Risk Susceptibility Map for the area. 'Reclaiming and reusing derelict land'. This development does not meet these conditions. Marske has always maintained its own distinctive character. This would be completely compromised by your Housing Plan, not just to the detriment of Marske, but to the detriment of the whole of East Cleveland. Schools and Doctors services are not adequate to cope with an influx of people to the extent you intent. Parking is at a premium now and will be made impossible by this amount of extra cars/traffic. The crossroads of Longbeck/Redcar Road/Churchill Drive is already an accident waiting to happen, extra traffic on the scale anticipated at this congested crossroads is unthinkable. The only winners I can see are the builders and the council. Time to listen to the people of Marske and halt this plan before any of our money is wasted on it.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. Comment summary:

Re the plans for new housing in Marske by the West Midlands Pension Fund, we in Marske do not want a urban sprawl built on a flood plain. The scale of the plan is mind blowing. Where did the 1,000 houses, 8 bay petrol station. take-away drive thru. pub/restaurant and 60 bed hotel come from? The land in question is outside development limits and also a greenfield site. As a resident of Marske this development will adversely affect my quality of life in many ways ie: the environment, traffic and safety and health care (strain on GP services). The size of this village will increase by 30%. Do you intend to concrete over most of East Cleveland? I would like to think just for a change you will listen to what people want, and scrap this plan.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate

some greenfield sites in order to meet identified housing needs. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085.

Comment summary:

The site is too big and out of keeping with the village character. There is not enough parking. There is no demand for this amount of housing. There is not the required infrastructure to support the development. The site will impact on landscape character. The development will increase flood risk. The road network will not be able to cope with the increase in traffic. The development will lead to a loss of privacy. Brownfield sites should be selected first.

Officer response:

The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required to meet needs arising from the development. The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. (of traffic) This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These

maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category "A", which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Section/Policy**Policy H 3.1****Marske Inn Farm Strategic Site**

DLP149**Full Name:** Mr Paul Booth**Organisation:****Agent Name:****Agent Organisation:****Submission type:** Web**Agree with section?:** No**Comment summary:**

This site should not be considered for development. The draft plan prematurely allocates this as housing land, prejudicing in favour of the current planning application, whilst ignoring the wishes and concerns of current residents. The adequacy of utilities supply has not been shown. The sewerage provision is already inadequate for the area, and there is no surface water drainage provision. It states that the A174 is a "defensible settlement boundary". One might have thought the same about the railway line. The population figures used to justify this are questionable. Already there is a screening application for 200 more green field houses at Windy Hill farm. There are many large new green field estates in surrounding towns. Huge numbers of objections have already been lodged against this planning application: these point out the reasons why this is ill conceived.

Officer response:

The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required to meet needs arising from the development. The policy already requires the resolution of water supply, sewerage and drainage requirements including off-site infrastructure enhancements, prior to development taking place. The policy already requires the resolution of water supply, sewerage and drainage requirements including off-site infrastructure enhancements, prior to development taking place. The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. It has been necessary for the Council to identify a strategic housing site of this scale to enable the delivery of a sufficient supply of housing to meet the identified housing needs of the borough across the plan period. After assessing several options in the conurbation area, which is the main focus for employment, population and development within the borough, the area to the south of Marske was considered by the Council to present the most sustainable and acceptable option due to its location close to public transport facilities and other services and because it is less constrained by environmental and planning policy considerations. Within this broad area, the Marske Inn Farm site is considered to be the most sustainable, accessible and developable site option.

Comment summary:

Practically every other objection I have registered so far comes back to this, relates to the way that the Draft Plan is so flawed as to make this possible, or so ignored as to permit it. This development increases the existing risk of surface water flooding, is out of character with its surroundings and destroys green belt. It is based on a flawed economic premise - 'build houses and the jobs will come'. It is not supported by adequate infrastructure. The rail links are 'in decline' - there are no concrete plans to arrest this. The Council appear to think that only Redcar has traffic congestion and has no plans for dealing with the movement of 3,000 extra cars in and out of Teesside. Parking in Marske will be choked as will access via traffic lights or level crossing in and out of the village. Provision of extra primary school places in unclear and non existent for secondary. There is no extra GP provision planned. The plans include a 60 bed hotel, restaurant, drive through fast food outlet and eight lane petrol station. These are not required, out of character and threaten existing businesses. The ground in question is in an elevated position above the village, and yet the skyline will be impacted by 4 storey buildings completely overpowering the aesthetic character of our rural community.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 4, which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. There is no green belt designation within Redcar and Cleveland. However, the Local Plan protects green and open spaces as identified on the proposals map and protects the rural area through the establishment of development limits surrounding the main settlements. The space between Marske and New Marske is designated as a strategic gap between the conurbation and rural area under Policy N2. Whilst it is recognised that the proposals would result in a narrowing of the strategic gap between Marske and New Marske, the policy indicates that a deep planting buffer will be provided along the A174, which will help to reinforce the strategic gap and retain its integrity. Accessible open space will also be required as part of the

development in accordance with Policy N3. The Local Plan seeks to support economic growth and job creation alongside providing an adequate supply of housing to meet identified needs. House building is a key economic sector, with housing development and economic growth intrinsically linked. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The policy seeks to deliver a strategic housing site for up to approximately 1,000 dwellings, supporting community facilities, infrastructure and public open space. The Policy does not propose a hotel, pub/restaurant, drive-thru restaurant or petrol filling station. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. The design of the proposals will be considered at the planning application stage.

Comment summary:

Please note that I wish to register my objection to the Redcar and Cleveland plan to, build a vast new housing estate at Marske on a greenfield site turning the village of Marske into a huge housing estate. This is wanton destruction and is a completely unsustainable practice. I also object to exposing our citizens to the risk of flooding and vastly increased traffic which will put pedestrians, cyclists and people walking or pursuing leisure pursuits into direct conflict and danger with motorists who seem to dominate our society these days thanks to short sighted and unsustainable planning like this is. If there is a need then please redevelop elsewhere on brownfield or redeveloped sites illustrating the future with some smart thinking and design rather than taking the easy way of using the bulldozer to destroy Englands fields of green one by one.

Officer response:

The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs.

DLP118**Full Name:** Ashley Walker**Organisation:****Agent Name:****Agent Organisation:****Submission type:** Letter**Agree with section?:** No**Comment summary:**

There is no demand for this amount of housing. The site is outside development limits. Brownfield sites should be selected first. The site is too big and out of keeping with the existing character of Marske. The plan should recognise current economic restraints. It should focus on existing communities and strengths and should engage individual local communities to meet their specific needs.

Officer response:

The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The development limit boundaries are being reviewed as part of the process of updating the Local Plan. The existing development limits boundary would be amended to include the site within development limits. The amendment to development limits formed part of the consultation on the Local Plan. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement.

Comment summary:

I have already sent my objections to the portion of the plan ,which contains the policy to develop land at Marske In farm. This email is to confirm two things (1) that my objection is still viable(2) if not then to make this objection my prime objection. The reason for my objections are based on the facts: 1 we do not need more housing at Marske 2 we do not need more housing on the Marske bypass(a bypass is to take traffic away from homes, something the council ignores) 3 there are flooding problems 4 health service issue 5 schooling issues 6 traffic issues and many more reason to reject this proposal. It is stupid. Your policy is one of gaining more money from rates, creating a joined up community in redcar/marske and ignoring the local community. I reject this proposal out right.

Officer response:

The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. Comment summary:

As a resident of Marske, this development will adversely affect my and my family's quality of life in many ways; the environment, education, traffic & safety and healthcare. See below. I wish to very strongly object to the proposed development in Marske. I have family who own a property in Cat Flatt Lane Marske and are the moment living in a holiday cottage in another part of the borough, as they have been flooded out of their home along with the rest of the residents of Cat Flatt Lane and some of Cleveland View in Marske and are not expected to be back in their home before February 2014. This building work of new houses which is proposing on the land at Windy Hill Farm, has drainage problems before it is even started. Water stands on this land which can be clearly seen from the bypass when it has been raining, so how do the rest of Marske deal with this when they are flooded again, because Northumberland Water are not prepared to let the building people use the drains which are not suitable for more household waste etc. The local schools will be bursting at the seams, New Marske Primary, which was amalgamated from two schools the infant and junior school in 2000 with the loss of many school places. Also Errington School was also amalgamated and the land is up for sale at this moment again the loss of many school places, so where will the children go? Bydales, a fine school, but again has been built with the loss of places, did the council co-ordinate with their own Education Department when this was happening. I do know that the Education department looks many years ahead do you not speak to each other. The traffic on the High Street will be a major headache, as some sort of pathway will have to be made to come under the railway bridge as at the present moment there isn't a footpath, so imagine the first child to be run over and the heartache and of course the Council will be to blame. Longbeck Lane junction into Marske will have to be sorted, it is bad enough now, so what will it be like at between 08.00 and 08.45, when everybody is trying to get their kids to school. I have lived in Marske for 45 years and we have been very happy here, but quite honestly I feel so disgusted with what is happening to a lovely village, all because Redcar & Cleveland Council are so inept and unable to balance the books. We do not need more houses in Marske by the Sea, there are many houses for sale and please tell me who will buy the new ones.

Officer response:

The policy indicates that the proposals will be expected to provide a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking account the impact of the development on the landscape. In addition, the policy requires a landscape assessment and appropriate landscaping scheme throughout the site, including a deep planting buffer towards the A174 which reinforces the strategic gap with New Marske. Detailed consideration of the impact of the proposals upon the natural environment will be made as part of the planning application process. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required to meet needs arising from the development. Only surplus brownfield land at Errington Primary School has been allocated for housing development on Windy Hill Lane under Policy H3.16. No greenfield sites have been allocated for development on Windy Hill Lane. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need

to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy.

Comment summary:

I wish to protest, in the strongest possible terms, at the proposed housing development to the south of Marske by the Sea for a number of reasons, many of which I am quite sure you are already aware. a) drainage - NWA will not improve the drainage should this development go ahead. This would cause extremely serious problems for existing homes. b) schooling - Marske schools, especially primary schools are already full. Where would you expect to place future children caused by this expansion. c) greenfield v brownfield - there must be far more and better sites for development in the area. Leave the greenfield sites well alone. d) population - if anything, the population seems to be shrinking. Where would the new inhabitants come from. I see no reason for this expansion. e) congestion - only some over-paid, under-worked, brain-dead council planner could think having one-way traffic lights at the railway bridge, close to this possible development. It would bring absolute chaos to an already busy thoroughfare. I am quite certain there are other points against this proposed project, but I would respectfully request you give the above your consideration.

Officer response:

A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085.

Comment summary:

The Draft Local Plan shows a policy to develop land at Marske Inn Farm for houses which is seriously flawed. One wonders why when there is a good number of brownfield sites available these are not being used? A housing estate on the land at Marske Inn Farm would further destroy the agricultural aspect of the area and replace it with urban sprawl. As the population of the area is declining and there seems to be little prospect of an upturn in employment anywhere near where is the demand for more housing coming from? Northumbrian Water have said that no surface run off water can be directed into the existing drains and a large area of Marske is recognised as being very susceptible to ground water flooding. What plans have the Council to deal with this? The idea to make Marske High Street on way traffic at the railway bridge shows how little members know of the traffic using the road. An exit from the proposed estate in Longbeck Road would also cause unacceptable increase in traffic flow and congestion at the junction with Redcar Road and Churchill Drive. This Draft Plan shows a threat to Marske, its identity, safety and well being, and should be withdrawn immediately.

Officer response:

The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The Local Plan seeks to support economic growth and job creation. The plan also seeks to support the key industrial sectors of the port, chemicals, steel, and recycling industries whilst recognising the need to diversify the economy so that it is more resilient to change in the future. The plan also puts policies in place to support small and medium sized business as well as the tourism industry which has the potential for significant growth building upon the natural assets of the borough. House building is also a key economic sector, with housing development and economic growth intrinsically linked. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater

flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085.

Comment summary:

TEN GOOD REASONS NO ONE IN MARSKE WANT THIS URBAN SPRAWL. 1) it is a flood plain 2) a waste of good farm land. 3) Will not create employment in our village. 4) Will destroy our community. 5) Traffic will be horrific, already nothing is done to help people living on the Churchill estate who wish to cross Redcar Road. 6) Schools will be too small - CAN THIS BANKRUPT COUNCIL AFFORD TO BUILD NEW ONES! 7) Doctor surgeries are already full to capacity. 8) The consultation by great western were a complete lip service to the public of Marske many hope that it is not another Pullson Wilson affair and perhaps the audit commission should be involved? just a thought. 9) we have a mayor who says yes and no. 10) People in Marske and Redcar renting out their house because they do not sell. COMMENT: IF THIS ORCHESTRATED FAIT ACCOMPLI PLAN GOES THROUGH IT WILL BE A GREAT BLOW TO DEMOCRACY AND THE PEOPLE OF MARSKE. WE ARE ALL DISGUSTED AT THE LACK OF STRAIGHT ANSWERS FROM THE WESTERN PENSION FUND AND THE DEVIIOUS WAY THEY HAVE GONE ABOUT THINGS INC. THE COUNCIL. IT STINKS. Disgusted.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. The site comprises of predominantly Grade 3b land within the Agricultural Land Classification, which is not considered to be the best and most versatile agricultural land. Whilst some of the site is considered to be Grade 3a, it is considered that the loss of these relatively small areas of higher quality agricultural land will be outweighed by the benefits of the development in helping to meet identified housing needs in a sustainable location. The Local Plan seeks to support economic growth and job creation. The plan also seeks to support the key industrial sectors of the port, chemicals, steel, and recycling industries whilst recognising the need to diversify the economy so that it is more resilient to change in the future. The plan also puts policies in place to support small and medium sized business as well as the tourism industry which has the potential for significant growth building upon the natural assets of the borough. House building is also a key economic sector, with housing development and economic growth intrinsically linked. The plan would be outweighed by the benefits of the development in helping to meet identified housing needs in a sustainable location. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and

creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required to meet needs arising from the development. The Council expects developers to carry out a genuine and meaningful consultation with local residents, interest groups and recommended/statutory consultees at an early stage, as set out within the Council's adopted Statement of Community Involvement. However, there is no legal obligation for a developer to undertake pre-application consultation and it can only be encouraged by the Council. The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy.

Comment summary:

Marske Inn Farm (H3.01) - The proposal to develop this site for housing is disgraceful. It would, at a stroke, totally transform the town of Marske in a way which would be extremely damaging. Part of the area is subject to flooding and the surrounding road systems would not be able to cope with the huge increase in local traffic without major modifications for which there would inevitably be no money and in themselves would create further problems.

Officer response:

The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. Comment summary:

There are already several hundred houses for sale in the area - why do we need more? There are no jobs in the area to support this level of housing. The project will totally destroy the character of the village. The infrastructure cannot support this level of development. The roads will not be able to cope with the increased amount of traffic, which will lead to an increased level of gridlock, frustration and accidents. Brownfield sites should be used before greenfield sites. The area is already subject to repeated flooding and this level of development will inly make things worse.

Officer response:

The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The Local Plan seeks to support economic growth and job creation. The plan also seeks to support the key industrial sectors of the port, chemicals, steel, and recycling industries whilst recognising the need to diversify the economy so that it is more resilient to change in the future. The plan also puts policies in place to support small and medium sized business as well as the tourism industry which has the potential for significant growth building upon the natural assets of the borough. House building is also a key economic sector, with housing development and economic growth intrinsically linked. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British

Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Submission type: Web

Agree with section?: No

Comment summary:

As a resident of Marske-by-the-Sea, I wish to register objections to this section. 1. This site is currently outside the existing development limits for Marske-by-the-Sea and too close to a Scheduled Ancient Monument. 2. The area is subject to flooding; n.b. the recent events on Friday 6th September 2013. 3. The in/egress to the proposed development is likely to create traffic congestion in/out of the Village Centre. 4. The lack of dedicated Educational provision will create stress on the existing infrastructure both on additional pupil intake and commuting thereto. 5. Lack of comprehensive consultation of the existing residents of Marske-by-the-Sea. 6. Any further development on the farmland peripherals of the Village will denigrate the green-space surrounding same. Existing residents have no wish to become part of the greater conurbation of Redcar &/or New Marske. I would suggest that a survey of the number of existing vacant for sale/for rent properties within the environs of Marske-by-the-Sea be undertaken with respect to the employment opportunities available in the immediate or easily commutable area. There appears to be no specific identifiable need for this amount of accommodation other than a Central Government directive and/or a prospective, substantial, financial reward for developers.

Officer response:

The development limit boundaries are being reviewed as part of the process of updating the Local Plan. The existing development limits boundary would be amended to include the site within development limits. The amendment to development limits formed part of the consultation on the Local Plan. The policy will be amended to include more information on the archaeological requirements, including the need to undertake a prior evaluation of archaeological remains on the site. Reference has been made in the policy with regard to the need to agree a package of measures to conserve and enhance the appreciation and understanding of the scheduled monument. The Council will work closely with English Heritage to ensure that the impact of the development upon the scheduled monument would be acceptable and that its future is secured. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road

network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The Council expects developers to carry out a genuine and meaningful consultation with local residents, interest groups and recommended/statutory consultees at an early stage, as set out within the Council's adopted Statement of Community Involvement. However, there is no legal obligation for a developer to undertake pre-application consultation and it can only be encouraged by the Council. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. Accessible open space will also be required as part of the development in accordance with Policy N3. The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy.

Comment summary:

There are enough brown field sites in the whole area which can be used for new housing before encroaching onto green fields. Not enough investigation has gone into the flooding risks, especially as this happens in this area already. What is the sense in building more houses when there are no jobs available for the new occupants. Surely better to get the economy stabilised which will then attract people into the area. You stress affordable housing, but 3/4 bedroomed houses are not classed in the affordable bracket. What about those people just starting out on the housing ladder and would they want to live so far away from the shops of Marske.

Officer response:

The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The Local Plan seeks to support economic growth and job creation. The plan also seeks to support the key industrial sectors of the port, chemicals, steel, and recycling industries whilst recognising the need to diversify the economy so that it is more resilient to change in the future. The plan also puts policies in place to support small and medium sized business as well as the tourism industry which has the potential for significant

growth building upon the natural assets of the borough. House building is also a key economic sector, with housing development and economic growth intrinsically linked. The Tees Valley 2012 Strategic Housing Market Assessment (SHMA) provides the most up-to-date assessment of housing needs and aspirations in the borough and has been used to inform the policies within the plan. The plan overall seeks to meet the range of housing needs for different types of market and social housing, including increasing the supply of larger detached dwellings. The policy indicates that the development will be expected to provide a broad and appropriate housing mix, including the provision of affordable housing on-site.

Comment summary:

I don't agree with any part of this document. There is no provision for the prevention of more flooding which has ruined a large number of properties in Marske-by-the-sea. Nobody wants the new development south of the village and the village itself will be destroyed as we know it. Traffic chaos, flooding and more competition for our local businesses are just a number of the concerns we have. Stop building on greenfield land build them somewhere else. Like Warrenby....

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a

Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs.

DLP161		Comment summary:
Full Name:	Ann Sidgwick	<p>I strongly object to the Draft Plan. Especially with regard to Marske. We do not need more housing, there are over 500 houses for sale in the TS11 area. When ICI & British Steel were at their height the housing was quite adequate. Most of the jobs have gone so why the need for more housing? I was told at the consultation that by building more houses this will attract more business. Cart before horse comes to mind. The council itself has shed over 300 jobs & you just need to look at Redcar High Street to see all the business's that have closed. If you were able to sell the hotel (Look at how many hotels have closed in Redcar!), fast food development, petrol station, restaurant etc., these jobs will be few and by definition will be service base and more than likely zero hour / minimum wage contacts. You do not make clear where the 3-4,000 new residents will actually find employment You state that you aim to ensure 'housing is located where residents will have access to jobs, facilities and services whether they have access to a car or public transport or not'. You do not demonstrate how this condition is met within the Housing Plan. You state that 'providing new housing' will 'attract people back into the area to stabilise the community'. Surely Jobs are required first. You state that 'car ownership is increasing and traffic problems related to car-borne commuting are likely to follow'....The frequency of rail services has decreased, particularly the direct services to and from Saltburn to Middlesbrough'. The planned development at Marske would exacerbate this. All that a new development on the scale proposed would do would be to create more congestion, leading to more accidents. The bypass was built because of the high levels of traffic through the village, another 1,000 + cars would have a devastating effect on Marske. Not to mention the chaos on the school run which is bad enough as it is. You claim the Borough only has congestion problems in Redcar. You omit the problems getting in / out of Marske or along the single carriageway from Saltburn towards Redcar, or the congestion issue that your planned single carriageway at Marske railway bridge will inevitably create. Policy CS23 Green Infrastructure. You state 'The following green areas will be protected and, where appropriate, enhanced to improve their quality, value, multi-functionality and accessibility: a) Strategic gaps between Marske and New Marske; Marske and Saltburn; b) The green wedges in the conurbation. Clearly this is the absolute opposite of what is proposed in the Housing Plan.</p>

Comment summary:

I wish to object to the councils Draft Local Plan. The DLP is showing how the council sees the development of the area up to 2029. The particular part I object to is the development of the Marske Inn Farm area. In this area there are areas (BROWNFIELD SITES) that the council should develop using up areas that require investment in peoples future. Leave the green belt as it is. This provides a natural boundary to the village. Building to attract executive people to the area is flawed, where are the executive jobs? The unemployment figure for this area are already high. There is already plenty of building going on in Redcar. The redevelopment of the Lakes estate. Redcar Lane. There is still a significant amount of water lying in this area. Heavy rainfall will make it worse. All the work done on the stray and in Marske failed. It cannot cope with what we have now. The proposed alterations to the high street under the railway bridge, narrowing it and instaling traffic lights will only add to the traffic flow, creating more congestion. The DLP has already identified we will need increased school capacity by 2018. With a proposed build of 1000 homes this will place added pressure on the existing schools that are already at maximum capacity. The proposed DLP in its current form with the development of the Marske Inn Farm site represents a threat to the village and will alter our life style and effect the house prices and our safety. In my opinion this proposed development in the DLP should not go ahead, and the money spent elsewhere.

Officer response:

The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. There is no green belt designation within Redcar and Cleveland. However, the Local Plan protects green and open spaces as identified on the proposals map and protects the rural area through the establishment of development limits surrounding the main settlements. The space between Marske and New Marske is designated as a strategic gap between the conurbation and rural area under Policy N2. Whilst it is recognised that the proposals would result in a narrowing of the strategic gap between Marske and New Marske, the policy indicates that a deep planting buffer will be provided along the A174, which will help to reinforce the strategic gap and retain its integrity. Accessible open space will also be required as part of the development in accordance with Policy N3. The Local Plan seeks to support economic growth and job creation. The plan also seeks to support the key industrial sectors of the port, chemicals, steel, and recycling industries whilst recognising the need to diversify the economy so that it is more resilient to change in the future. The plan also puts policies in place to support small and medium sized business as well as the tourism industry which has the potential for significant growth building upon the natural assets of the borough. House building is also a key economic sector, with housing development and economic growth intrinsically linked. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage

systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The potential impact of the Local Plan on property values is not a material planning consideration and therefore cannot be taken into consideration in the preparation of the plan.

Comment summary:

Strongly objects to the proposals. The site is prone to flooding. The land is green belt or greenfield land, which I understand was not for building on. Impact upon traffic. SUDs would need to be used as Northumbrian Water have told the Council that no surface water can be diverted into existing drains/culverts. Problems relating to old mine working drainage. The health centre could not cope with extra demand. Impact upon school places and class sizes. Marske is a village and should be kept that way, not turned into a town.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development

and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The Policy indicates that the Council will seek to secure community facilities required as part of the development, including a primary school. It is anticipated that any new primary school required, will be delivered on site as part of the development. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement.

DLP558**Full Name:** Alan Evans**Organisation:****Agent Name:****Agent Organisation:****Submission type:** Letter**Agree with section?:** No**Comment summary:**

I wish to register my objections to the Draft Local Plan: It would seem obvious that the plan is to drastically lower the quality of life for the existing residents of Marske. Why would the Strategic Planning Team do this? Causing a glut of housing would be really counter-productive for this area. My objections are exactly as all those listed by the www.stopthehouses.co.uk website, along with those on the Word document available from the website. No doubt the Strategic Planning Team will be familiar with these objections - so to save time for all concerned, please accept them as my objection.

Officer response:

Policy SD4 of the Local Plan seeks to ensure that development is designed to a high standard, including ensuring that development will not have a significant adverse impact on the amenities of occupiers of existing or proposed nearby properties. The impact of the development upon residential amenity will be assessed as part of the planning application.

Marske Inn Farm Strategic Site

DLP550**Full Name:** Peter Boyes**Organisation:****Agent Name:****Agent Organisation:****Submission type:** E-Mail**Agree with section?:** No**Comment summary:**

As a resident of Marske, I strongly object to the proposed development application R/2013/0669 for the following reasons; 1. It is outside the development limits. It would increase the chance of future development in adjoining fields. 2. In effect, the development will be a self contained development, and will have no benefit to Marske. It has no plans for schools or doctors and would put added strain on the services already in Marske. 3. A 60 bed hotel? This is not needed in Marske. Who is it for? We did not receive an invite to the Community Consultation, so we did not have a chance to voice our opinion. This will ruin Marske. It will change the character of the village and is wholly unnecessary.

Officer response:

The development limit boundaries are being reviewed as part of the process of updating the Local Plan. The existing development limits boundary would be amended to include the site within development limits. The amendment to development limits formed part of the consultation on the Local Plan. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required to meet needs arising from the development. The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The Council expects developers to carry out a genuine and meaningful consultation with local residents, interest groups and recommended/statutory consultees at an early stage, as set out within the Council's adopted Statement of Community Involvement. However, there is no legal obligation for a developer to undertake pre-application consultation and it can only be encouraged by the Council.

The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore,

the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. Contributions will be required, as necessary, at the time of the application towards any infrastructure requirement, including car parking to meet needs arising from the development. Whilst it is recognised that the proposals would result in a narrowing of the strategic gap between Marske and New Marske, the policy indicates that a deep planting buffer will be provided towards the A174, which will help to reinforce the strategic gap and retain its integrity. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development.

Comment summary:

As a residents of Marske, this development will adversely affect my and my family's quality of life in many ways; the environment, education, traffic & safety and healthcare, see below. I wish to very strongly object to the proposed development in Marske. This building work which is proposing on to the land at Windy Hill Farm, there are drainage problems before it is even started. Water stands on that land which is clearly seen from the main road into Marske. The local schools will be bursting at the seams, New Marske Primary, which was amalgamated from two schools the infant and junior school in 2000 with the loss of many school places this was so the land could be sold by the R & C Council and houses built on it. Also Errington School was also amalgamated and the land is up for sale at this moment again the loss of many school places, so where will the children go? Bydales, a fine school, again has been built again and the loss of places there, did not the council envisage this building work was to happen, I do know that the Education department looks in to many years ahead so were they not consulted when the schools were made so much smaller. The traffic on the High Street will be a terrible headache, as some sort of pathway will have to be made to come under the railway bridge as at the present moment there isn't a footpath there under the bridge, so imagine the first child to be run over and the heartache and of course the Council will be to blame. Longbeck Lane junction into Marske will have to be sorted, it is bad enough now so what will it be like at between 08.00 and 08.45, when everybody is trying to get there kids to school. We have lived in Marske for many years are disgusted with the council and the Mayor for even considering this terrible blight on our beautiful landscape.

Officer response:

Policy SD4 of the Local Plan seeks to ensure that development is designed to a high standard, including ensuring that development will not have a significant adverse impact on the amenities of occupiers of existing or proposed nearby properties. The impact of the development upon residential amenity will be assessed as part of the planning application. The policy indicates that the proposals will be expected to provide a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking account the impact of the development on the landscape. In addition, the policy requires a landscape assessment and appropriate landscaping scheme throughout the site, including a deep planting buffer towards the A174 which reinforces the strategic gap with New Marske. Detailed consideration of the impact of the proposals upon the natural environment will be made as part of the planning application process. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. Only surplus brownfield land at Errington Primary School has been allocated for housing development on Windy Hill Lane under Policy H3.16. No greenfield sites have been allocated for development on Windy Hill Lane. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it

could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement.

Comment summary:

We the undersigned strongly object to any proposed development in or around Marske and can see no good reason why this should go ahead. (1) Why sacrifice Green field sites when there are available BROWN FIELD SITES. (2) Present Housing Requirments due not justify the building of 1000 new houses in Marske. (3) Increased Risk of Flooding. (4) Increase in Traffic. (5) Education needs will be affected.

Officer response:

The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. Comment summary:

I am emailing an objection to the proposed development at Marske. I have recently become aware of the DLP which shows the councils vision of how Marske may look by 2029 I am a resident of Marske an my objection is for a number of reasons which are detailed below. At the moment Marske by the Sea is a village which is one of the reasons we moved to the area well over 10 years ago. I feel that if this development and any others go ahead in this area the village will be greatly affected, There is going to be an increase of traffic throughout the whole of Marske but mainly the small shopping area and schools. If you base the figures on just one vehicle per household that is potentially 1000 extra cars on the roads meaning a minimum of 2000 extra journeys per day. But of course most households have more than one car so this figure would be much more than that. Whenever there are any roadworks in this area it creates a lot of congestion and time delays, can you imagine how much worse that would be with the extra traffic lights and the extra vehicles. Many of these households will have children needing a school place. When our family moved to the area over 10 years ago we had difficulty getting a primary school place for our son but managed eventually. A friend of mine approx 5-6 years ago was advised there was no room in the year group at Bydales for her son although they could fit her daughter in. It was only after she was advise that two children had moved out of the year group that he got a place. I am sure this is going to be a major issue with the extra residents. A lot of these children on both primary and secondary schools are now driven too and collected from school causing even more traffic problems. My other major concern is flooding to the surrounding areas, whenever we get heavy rain on the area the drains near our property are unable to cope and have reported this to the Waterboard on two or three occasions so far this year. Although it states that they are looking to use the SUDS system there is still going to be less land to soak up the rain throughout the area. There is also no guarantee that the SUDS system will be able to cope with all the surface water. As mentioned previously Markse is a village and if all these additional houses are built I don't think Marske will have that village feel to it for much longer. I am sure I am not alone with voicing these concerns but please ensure they are dealt with by the correct people.

Officer response:

The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all

forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place.

Comment summary:

We can see no evidence for the need for the proposed development given the national decline in manufacturing and industry and thus the need for housing to accommodate a decreasing number of families wanting accommodation. Concerns over flooding after heavy rainfall. The drainage system cannot cope at the moment and the proposals will make this situation worse. The present roads can barely cope with the volume of traffic in Marske, especially at the start and end of a school day, leading to long tailbacks and near misses which we personally witness on a daily basis. As for the other proposals: petrol station, takeaway drive-thru, pub and hotel, what commercial organisation would be likely to invest in such schemes? Where is there any evidence of the need or desirability for such amenities? The soul and identity of the village of Marske by the Sea should be treasured for what it is: a historic and separate community - not an amorphous mass of housing forming a suburb of Redcar.

Officer response:

The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. Comment summary:

I wish to register my objection to the recent Draft Local Plan. As a plan I think it's tenants will be a disaster for the community of Marske and New Marske and destroy years of history and community for both villages. As a resident of Marske for over 30 years I cannot see the relevance or economic benefit of new developments in the Marske area particularly any development which ostensibly joins two communities separated throughout history. It seems that the council is determined to destroy the remaining green field sights around Marske which are our heritage to protect and that we hold in trust for future generations. It would seem that there are existing brown field sites which could be utilised by the council to fulfil their rapacious demands for housing expansion and council tax income. Why has this not been considered ? Where does the council see the demand for such developments being filled ? We are an area of high unemployment with houses up for sale in modern estates such as the lngs and Mickledales..how will these new stock be sold when there is no new investment in new businesses and new employers ? The Wilton site cannot be seen as the golden triangle of employment..it continues to shrink not expand ! The environmental impact of developments at Longbeck could be severe. Those who witnessed the recent floods despair at attempts to suggest that the risk of flooding can be minimised by sustainable drainage systems ! We would risk flooding around Marske and in the housing estates around the village. Other objections I hold would be: Overcrowding of existing education provision Increase in traffic and congestion. I would stress in my objections that I am not nor ever have been a card carrying environmental warrior. I am however a concerned resident , council tax payer and voter who believes that the DLP is flawed and would cause untold damage to a community which has thrived without the addition of a totally illogical housing development which smacks of rampant exploitation by an authority which is supposed to protect it's valued communities not destroy them.

Officer response:

The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the

site and indicates that these must be resolved to enable the development to take place. The Council has prioritised development on the most sustainable sites to meet identified housing needs, whilst ensuring that sites are viable for residential development and have a realistic prospect of being delivered within the plan period. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. Policy TA2 also includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085.

DLP473**Comment summary:****Officer response:****Full Name:** Mrs H R Wildon

With reference to our objection of house building on green field sites in Redcar & Marske. Once a precedent is set, any green spaces will be swallowed up by the demand of house building. The Labour Party's manifesto promises to protect local green spaces from house building is not being upheld. Reneging on promises will lose a lot of loyal Labour voters.

The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. Policy N2 will continue to protect open spaces which have been identified for protection. Accessible open space will also be required as part of the development in accordance with Policy N3.

Comment summary:

I am writing to lodge my objections to the above plan. My objections are to the plan in general and in particular how it affects Marske. THE NEED FOR HOUSING IN REDCAR & CLEVELAND: Redcar & Cleveland has higher unemployment than the North East in general and also nationally. The population in the borough is declining due to the lack of jobs; Future predictions show further decline. Also jobs at the Wilton site are predicted to fall in the future. IF THERE IS NO PROSPECT OF MORE JOBS TO BRING PEOPLE TO THE AREA (AND THE POPULATION IS DECLINING) WHERE IS THE NEED FOR ALL THIS NEW HOUSING. BROWNFIELD SITES/GREENFIELD SITES: The DLP states there is a good supply of brownfield sites so why is another greenfield site being proposed at Marske. There will also be the loss of highly productive arable land if housing is built on greenfield sites at Marske. IF THE COUNCIL HAVE ALREADY EXTENDED DEVELOPMENT LIMITS TO INCLUDE GREENFIELD SITES AT MARSKE. HOW WAS THIS DONE WITHOUT EXTENSIVE CONSULTATION WITH RESIDENTS? THE DLP ALSO STATES THAT MARSKE HAS ALWAYS MAINTAINED ITS DISTINCTIVE CHARACTER. IT IS CLEAR THAT MARSKE IS ONE OF MANY VILLAGES IN THE AREA WHICH WILL HAVE THEIR 'CHARACTER DESTROYED IF THIS PLAN IS ALLOWED TO BE IMPLEMENTED. OBJECTIONS SPECIFIC TO MARSKE: The use of greenfield sites as mentioned above. Marske does not have the infrastructure to cope with the proposed new houses. FLOODING The Council and the Developer have no option than to uses SUDS as Northumbrian Water have stated NO surface water can be directed in to existing drains/culverts and the DLP states that the entire area is unsuitable for soil infiltration based SUDS Then where is the water from the HUGE PROPOSED WATER STORAGE TANKS TO GO WHEN IT IS RELEASED The Tanks built by NWA were supposed to limit discharge on to the beach ONCE IN 5 YEARS, Last November alone they discharged on to Marske beach 3 times and there have been several spill events this year. TRAFFIC: Traffic Lights at the Railway bridge in marske would result in intolerable delays and congestion and could cause major problems for emergency vehicles. Parking in Marske is already a problem this would be greatly exacerbated if 1000 plus houses were built. EDUCATION: The majority of the children in Marske and New Marske wish to receive their secondary education in Marske. There would be a large increase in numbers of children wishing to go the school in their own village and not as the council suggests be included in the borough wide catchment area which would result in many of them have to travel some distance to receive their secondary education.

Officer response:

The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The Council has prioritised development on the most sustainable sites to meet identified housing needs, whilst ensuring that sites are viable for residential development and have a realistic prospect of being delivered within the plan period. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. Policy TA2 also includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The site comprises of predominantly Grade 3b land within the Agricultural Land Classification, which is not considered to be the best and most versatile agricultural land. Whilst some of the site is considered to be Grade 3a, it is considered that the loss of these relatively small areas of higher quality agricultural land would be outweighed by the benefits of the development in helping to meet identified housing needs in a sustainable location. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for

groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The Council expects developers to carry out a genuine and meaningful consultation with local residents, interest groups and recommended/statutory consultees at an early stage, as set out within the Council's adopted Statement of Community Involvement. However, there is no legal obligation for a developer to undertake pre-application consultation and it can only be encouraged by the Council.

Comment summary:

With reference to our objection of house building on green field sites in Redcar & Marske. Once a precedent is set, any green spaces will be swallowed up by the demand of house building. The Labour Party's manifesto promises to protect local green spaces from house building is not being upheld. Reneging on promises will lose a lot of loyal Labour voters.

Officer response:

The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. Policy N2 will continue to protect open spaces which have been identified for protection. Accessible open space will also be required as part of the development in accordance with Policy N3.

Comment summary:

I write to you to object strongly, to the proposed development at Marske. We have seen a small village gradually become a large village over the last twenty or more years, and we don't want to see it become more than that. We certainly don't want it to become part of Redcar, New Marske or Saltburn. There is already too little an area between us. Traffic in and through Marske is almost continual, and grid-locked on the High Street when the school (especially Bydales) turn out! Not only in Marske, but also there is a never ending stream of traffic along the by-pass and up to Four Lane End, going to Skelton, at the end of a working day. With the amount of cars put onto these roads with the building of more houses it would be chaos. And no more roads leading onto the already heavily used ones! That would be accidents waiting to happen There are not enough job opportunities here to warrant more housing, certainly not on the scale proposed. Even now we are looking at job loses at Tata Steel, and more shops are closing in Redcar. Therefore I wish to add my objection to the Draft Local Plan.

Officer response:

The development limit boundaries are being reviewed as part of the process of updating the Local Plan. The existing development limits boundary would be amended to include the site within development limits. The amendment Whilst it is recognised that the proposals would result in a narrowing of the strategic gap between Marske and New Marske, the policy indicates that a deep planting buffer will be provided towards the A174, which will help to reinforce the strategic gap and retain its integrity. to development limits formed part of the consultation on the Local Plan. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The Local Plan seeks to support economic growth and job creation. The plan also seeks to support the key industrial sectors of the port, chemicals, steel, and recycling industries whilst recognising the need to diversify the economy so that it is more resilient to change in the future. The plan also puts policies in place to support small and medium sized business as well as the tourism industry which has the potential for significant growth building upon the natural assets of the borough. House building is also a key economic sector, with housing development and economic growth intrinsically linked.

Comment summary:

I would protest at the Draft Local Plans as published and apparent extension of development limits to now include greenfield land - with no consultation with Marske people. There is plenty of brownfield land around so use it. When business can buy up farming land cheap and sell it on as building land it stinks of profiteering and more fat cows doing well! Our population is declining and yet you wish to build 1000 houses - traffic congestion, floodwater and loss of identity will create chaos in Marske. What a shambles roll on elections.

Officer response:

The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. We have undertaken a 6 week consultation on the draft Local Plan. Throughout the consultation period we held a number of drop-in sessions throughout the Borough, including in Marske, where people could discuss the Plan with Council officers. The consultation and drop-in events were advertised on the Council's website, resident's magazine and notification sent to those on our consultation database. The Council will also hold a 6 week consultation on the Publication draft of the Local Plan. Notification will be sent to those on our consultation database to inform them of the consultation, including anyone who has commented on the draft Local Plan. All of our consultation procedures are set out in the adopted Statement of Community Involvement. The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 2, which means there is potential for groundwater flooding

to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. I am writing to strongly object to the proposed development at Marske (Application reference R/2013/0669) as outlined in the draft local plan I'm objecting for the following reasons:- Traffic and Safety - Access to the proposed site via Longbeck Road would cause congestion on Longbeck Road and significantly increase the risk of accidents. There is already a build up of traffic on this road when the level crossing is down. Low level sun can be blinding on Longbeck Road and having traffic pulling out from the site could be highly dangerous. Also the possible restrictions and introduction of single lane traffic at the railway bridge will add further congestion and delays at that end of the village. At the very least you need to revisit the access plans to this development. Flood Risk - On numerous occasions heavy rain has caused flooding on Longbeck Road near to the railway crossing. The downpour in September also resulted in flooding on Sherwood Drive. The proposed development would significantly increase the risk and frequency of floods happening in the future. Green Field Sites - Before any development on this scale is allowed to take place you surely need to ensure that the existing housing stock is saleable, new stock is built on brownfield sites and there is DEMAND for this sustained by new jobs. None of this appears to be in the Plan at the moment. Building the development on Green Field sites will ruin the open views of the existing properties on Sherwood Drive and will have a detrimental effect on house prices. Schools - Has enough thought gone into the longer term strategy for the successful education of our children? Are we sure that the existing provision will be able to cope with a potential influx of children over the coming years? We cannot afford to fail to give our children the best start in life. Hotel - I don't understand who wants the inclusion of a 60 bed hotel. Who is going to stay here? And why would you want a hotel that will draw business away from the already hard pressed established business's in Marske and the surrounding ares, and also pull trade away from the the village high street. I know that people have to live somewhere, but this surely canâ€™t be just about money and profit, there must be some considerations given to peopleâ€™s quality and way of life. The size and scale of the development is just too big, I fear that this development will totally ruin the character of our village and remove one of the reasons that people have for wanting to move here. You state 'Marske has always maintained its own distinctive character'. This would be completely compromised by your Housing Plan, not just to the detriment of Marske, but to the detriment of the whole of East Cleveland. If you must build here, then restrict the size of the development to preserve the character of our village. It does surely come down to this - Marske is a village and the residents wish it to remain so.

This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The site lies within Flood Zone 1 of the Environment Agencyâ€™s Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Governmentâ€™s latest household projection figures, economic growth forecasts and the Councilâ€™s desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be

resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. The potential impact of the Local Plan on property values is not a material planning consideration and therefore cannot be taken into consideration in the preparation of the plan. The potential impact of the Local Plan on the loss of a view is not a material planning consideration and therefore cannot be taken into consideration in the preparation of the plan. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The policy seeks to deliver a strategic housing site for up to approximately 1,000 dwellings, supporting community facilities, infrastructure and public open space. The Policy does not propose a hotel, pub/restaurant, drive-thru restaurant or petrol filling station. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement.

Comment summary:

This letter is to register my objection to your Draft Local Plan. I live as you see, in Marske, it is a village and the majority of Marske residents wish it to remain so. We have no wish to be enlarged, or joined to Saltburn, New Marske or Redcar. We wish to have good green boundaries surrounding and separating our villages not become part of some vast urban development. You propose vast numbers of new homes, who for? Where are the permanent jobs to support this growth? Many people are losing jobs without more permanent employment who can afford to buy them? The proposed Marske development already has great problems. Northumbrian Water state that no further surface run-off water can go into the existing drainage so SUDS would have to be used and the Development Plan states this area is unsuitable geologically for SUDS to be used so on-site storage tanks would probably have to be used instead. These have already proved problematic on the Stray, why would they be any better on this large housing development? There are some brownfield sites available and plenty of empty properties in the area. If housing is urgently needed convert empty sites and shops back into private accommodation, most of the ground work would be done already and surely a conversion is more cost effective than a new build (even without consultations). Roads, schools, doctors, dentists are already strained, further numbers of people would worsen the situation. Longbeck Road and Marske High Street are both trouble spots with traffic backed-up. How would even more cars on these roads prove advantageous? Even using public transport, especially buses, is not an option as apart from Marske High Street there is not a reliable service to any of the proposed areas. The Arriva Service seems very patchy in East Cleveland so more proposed passengers would not be the answer!! Without huge numbers of permanent employment being found I would have thought further housing development on this scale unnecessary. Without jobs-mortgages and rent are out of the question, Redcar already has new housing estates built with properties still unsold. Its no good building houses you can't sell!! The North East is an area badly hit by the recession, this area particularly. Jobs are going every day, even more so now in the bigger employment areas like Middlesbrough. Until this situation improves why someone thinks more new housing is the answer is beyond me. Leave the small villages alone. No-one wants to become part of this proposed urban sprawl and we will keep objecting at every available opportunity.

Officer response:

The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. Whilst it is recognised that the proposals would result in a narrowing of the strategic gap between Marske and New Marske, the policy indicates that a deep planting buffer will be provided towards the A174, which will help to reinforce the strategic gap and retain its integrity. The open spaces between Marske and Saltburn, and Marske and Redcar will continue to be protected as a strategic gap and green wedge respectively under Policy N2. The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The Council has prioritised development on the most sustainable sites to meet identified housing needs, whilst ensuring that sites are viable for residential development and have a realistic prospect of being delivered within the plan period. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. Policy TA2 also includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be

required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The Council expects developers to carry out a genuine and meaningful consultation with local residents, interest groups and recommended/statutory consultees at an early stage, as set out within the Council's adopted Statement of Community Involvement. However, there is no legal obligation for a developer to undertake pre-application consultation and it can only be encouraged by the Council.

Comment summary:

I strongly object to this development the increased flooding risk is frightening my daughter has already been flooded so I dread to think what will happen if you build on this site. Would the counsel by all these flooded houses at a price that the people affected could by other property in the village. We do not need more pubs hotels etc what we have are struggling do u want to put them all out of business. Schools would struggle. traffic would be dangerous. Where would all these people work We have not got jobs for people now gone are the days of ICI and BRITISH STEEL my Grandchildren look forward to a bleak future. PLEASE DONT MAKE IT WORSE

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. The policy seeks to deliver a strategic housing site for up to approximately 1,000 dwellings, supporting community facilities, infrastructure and public open space. The Policy does not propose a hotel, pub/restaurant, drive-thru restaurant or petrol filling station. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are

considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Local Plan seeks to support economic growth and job creation. The plan also seeks to support the key industrial sectors of the port, chemicals, steel, and recycling industries whilst recognising the need to diversify the economy so that it is more resilient to change in the future. The plan also puts policies in place to support small and medium sized business as well as the tourism industry which has the potential for significant growth building upon the natural assets of the borough. House building is also a key economic sector, with housing development and economic growth intrinsically linked.

Comment summary:

The plan focuses primarily on Greenfield sites, rather than brownfield. It will reduce the appeal of our area. The extra housing is driven by developers rather than by demand. The type of housing on the main site, will predominantly have four bedroom detached houses on it. This is what the developer will look to build. These houses will not improve home ownership in the area. Brownfield sites developed in other areas of the borough such as Redcar and Greater Eston will enable smaller homes and homes more affordable to first time buyers. The problem is that developers won't make as their money in these areas so they are not as interested. Since 2006, agents working on behalf of the land owners of the South of Marske site have lobbied for development limits to be changed to the south of Marske. The proposals will cause great flooding issues in Marske if developed. The fact the whole local plans economic future rests on such a fanciful development is disturbing. The rural conurbation of Marske will be altered in both character and value. It is likely higher earners will move into Yorkshire away from Redcar and Cleveland due to the increased traffic congestion from this development. The Local Plan and the Economic Masterplan before it fail to mention high-tech or niche industry. They don't offer any alternative to the large industrial decline. The notion of creative industries has already failed in Redcar it doesn't offer enough money to purchase the kind of properties mentioned in the plan.

Officer response:

The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The Tees Valley 2012 Strategic Housing Market Assessment (SHMA) provides the most up-to-date assessment of housing needs and aspirations in the borough and has been used to inform the policies within the plan. The plan overall seeks to meet the range of housing needs for different types of market and social housing, including increasing the supply of larger detached dwellings. The policy indicates that the development will be expected to provide a broad and appropriate housing mix, including the provision of affordable housing on-site. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The development limit boundaries are being reviewed as part of the process of updating the Local Plan. The existing development limits boundary would be amended to include the site within development limits. The amendment to development limits formed part of the consultation on the Local Plan. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas

most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. The Local Plan seeks to support economic growth and job creation. The plan also seeks to support the key industrial sectors of the port, chemicals, steel, and recycling industries whilst recognising the need to diversify the economy so that it is more resilient to change in the future. The plan also puts policies in place to support small and medium sized business as well as the tourism industry which has the potential for significant growth building upon the natural assets of the borough. House building is also a key economic sector, with housing development and economic growth intrinsically linked. The Economic Development section of the Local Plan seeks to support all aspects of the economy, including high tech and niche industries. Policy ED6 indicates that high tech and knowledge driven development should be focused at Kirkleatham Business Park and Cleveland Gate Business Park. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport.

DLP637**Full Name:** Mrs Sally Sansom**Organisation:****Agent Name:****Agent Organisation:****Submission type:** E-Mail**Agree with section?:** No**Comment summary:**

Development should be on brownfield sites not greenfield. Land is used as productive farmland and would be lost forever. Proposals would damage the distinctive character of Marske. If you must build houses, consider a much smaller development. There is a declining population and no jobs to attract people to the area, so no need for the housing or hotel.

Officer response:

The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The site comprises of predominantly Grade 3b land within the Agricultural Land Classification, which is not considered to be the best and most versatile agricultural land. Whilst some of the site is considered to be Grade 3a, it is considered that the loss of these relatively small areas of higher quality agricultural land would be outweighed by the benefits of the development in helping to meet identified housing needs in a sustainable location. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The policy seeks to deliver a strategic housing site for up to approximately 1,000 dwellings, supporting community facilities, infrastructure and public open space. The Policy does not propose a hotel.

Comment summary:

Our main concern is the increased flood risk as Northumbrian Water states that existing drains are at full capacity and storage tanks are going to have to be used. Existing tanks on The Stray failed to work in the recent flash flood and some properties very close to us suffered horrific flooding. Marske by Sea is very susceptible to rainwater flooding as stated in the British Geological Survey. There will be increased traffic in the High Street due to the narrow roads, also at the junction of Redcar Road and Churchill Drive where the existing traffic at rush hours is unbearable. Existing schools in Marske and New Marske will be up to capacity by 2018 and there are no plans to build new schools. Due to the collapse of the housing market and downturn of the economic situation new housing is not required. The proposed development of the housing does nothing to enhance the character of Marske by Sea.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. Comment summary:

Object to the proposals and any other site in Marske. The DLP states that there is a good supply of brownfield land so why is it that greenfield sites should be given over to new housing? With the loss of this farm land you are taking away land where crops could be grown to produce food to feed the people already in our area forced to rely on food banks to help them out. Loss of distinctive character. Proposals will merge Marske and New Marske. There are no jobs for the new residents, jobs are continuing to be lost at Wilton. In the last few months we have seen flooding in parts of Marske for the first time with more houses and Northumbrian Water will not be able to have run off water directed into existing drains and culverts will that be our houses? There will be an increase of traffic and with traffic lights, however temporary at the Longbeck/Churchill drive junction at the moment is this a taster of what is to come? Why should we have to put up with over crowded class rooms with the influx of more children, oh no this wont happen as the last census shows a lowering of the population, so we don't need more houses.

Officer response:

The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. Officer response:

The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The Local Plan seeks to support economic growth and job creation. The plan also seeks to support the key industrial sectors of the port, chemicals, steel, and recycling industries whilst recognising the need to diversify the economy so that it is more resilient to change in the future. The plan also puts policies in place to support small and medium sized business as well as the tourism industry which has the potential for significant growth building upon the natural assets of the borough. House building is also a key economic sector, with housing development and economic growth intrinsically linked. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. Whilst it is recognised that the proposals would result in a narrowing of the strategic gap between Marske and New Marske, the policy indicates that a deep planting buffer will be provided towards the A174, which will help to reinforce the strategic gap and retain its integrity. The site comprises of predominantly Grade 3b land within the Agricultural Land Classification, which is not considered to be the best and most versatile agricultural land. Whilst some of the site is considered to be Grade 3a, it is considered that the loss of these relatively small areas of higher quality agricultural land would be outweighed by the benefits of the development in helping to meet identified housing needs in a sustainable location. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type

and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development.

Comment summary:

Loss of community spirit. Local authority, land owners and developers just thinking about profit. The drainage and sewerage systems are already at the stage of overcapacity and the suggestion of a storage rain water system won't work in practice. Houses are slow to sell in this area and jobs are difficult to find with no indication that employment is improving I suggest that this proposed housing development should be delayed until there is an increase in employment. There are brown field sites in this area which should be developed first rather than to take prime agricultural land - green field sites. Traffic concerns. Do not support proposal to narrow carriageway under railway bridge to one lane. Schools are at near capacity and likely to become worse due to rising birthrate nationally. No need for a park and ride facility. No need for a hotel. There has been an insufficient level of public consultation on the proposals. Plan should be put to a democratic vote.

Officer response:

The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The Local Plan seeks to support economic growth and job creation. The plan also seeks to support the key industrial sectors of the port, chemicals, steel, and recycling industries whilst recognising the need to diversify the economy so that it is more resilient to change in the future. The plan also puts policies in place to support small and medium sized business as well as the tourism industry which has the potential for significant growth building upon the natural assets of the borough. House building is also a key economic sector, with housing development and economic growth intrinsically linked. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. The site comprises of predominantly Grade 3b land within the Agricultural Land Classification, which is not considered to be the best and most versatile agricultural land. Whilst some of the site is considered to be Grade 3a, it is considered that the loss of these relatively small areas of higher quality agricultural land would be outweighed by the benefits of the development in helping to meet identified housing needs in a sustainable location. Through good design, it is anticipated that the development can be made to complement the existing settlement. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period)

or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The policy seeks to deliver a strategic housing site for up to approximately 1,000 dwellings, supporting community facilities, infrastructure and public open space. The Policy does not propose a park and ride facility or hotel. The Council expects developers to carry out a genuine and meaningful consultation with local residents, interest groups and recommended/statutory consultees at an early stage, as set out within the Council's adopted Statement of Community Involvement. However, there is no legal obligation for a developer to undertake pre-application consultation and it can only be encouraged by the Council. of consultation events. We have undertaken a 6 week consultation on the draft Local Plan. Throughout the consultation period we held a number of

drop-in sessions throughout the Borough, including in Marske, where people could discuss the Plan with Council officers. The consultation and drop-in events were advertised on the Council's website, resident's magazine and notification sent to those on our consultation database. The Council will also hold a 6 week consultation on the Publication draft of the Local Plan. Notification will be send to those on our consultation database to inform them of the consultation, including anyone who has commented on the draft Local Plan. All of our consultation procedures are set out in the adopted Statement of Community Involvement.

Comment summary:

Oppose the development plans for Marske. The proposals would ruin the village character. Proposals would cause chaos to schooling and transport. Plan is based on providing new housing to contribute to economic development and population retention, however there are no jobs in the area to attract people to buy these executive houses. Marske already suffers from drainage and sewerage problems, which the proposals would make worse. The plan realises that a SUDs solution would be unsuitable. Proposals to narrow Marske High Street to one lane would cause even worse congestion, which will affect businesses too. Traffic would prevent tourism coming to Marske. Unhappy the Council has asked for a financial contribution towards school provision instead of a new school. Concerned about the lack of school places.

Officer response:

The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The Tees Valley 2012 Strategic Housing Market Assessment (SHMA) provides the most up-to-date assessment of housing needs and aspirations in the borough and has been used to inform the policies within the plan. The plan overall seeks to meet the range of housing needs for different types of market and social housing, including increasing the supply of larger detached dwellings. The policy indicates that the development will be expected to provide a broad and appropriate housing mix, including the provision of affordable housing on-site. The Local Plan seeks to support economic growth and job creation. The plan also seeks to support the key industrial sectors of the port, chemicals, steel, and recycling industries whilst recognising the need to diversify the economy so that it is more resilient to change in the future. The plan also puts policies in place to support small and medium sized business as well as the tourism industry which has the potential for significant growth building upon the natural assets of the borough. House building is also a key economic sector, with housing development and economic growth intrinsically linked. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement and any impacts upon the attractiveness of Marske as a tourist destination can be minimised. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site

layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is anticipated that any new primary school required, will be delivered on site as part of the development. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development.

Comment summary:

In response to the proposed development at Marske I must point out why it must be reconsidered. Without the guarantee of many new permanent jobs coming into the area there is no purpose to most of the proposal. Taking away greenfield land; increasing traffic congestion, flooding risks etc. will not give present residents and any new ones an improved quality of life. In fact, the opposite will occur. Many people now commute long distances to work because they value being able to live in an area with many of the facilities that are now provided by communities such as Marske. The Local Plan seeks to support economic growth and job creation. The plan also seeks to support the key industrial sectors of the port, chemicals, steel, and recycling industries whilst recognising the need to diversify the economy so that it is more resilient to change in the future. The plan also puts policies in place to support small and medium sized business as well as the tourism industry which has the potential for significant growth building upon the natural assets of the borough. House building is also a key economic sector, with housing development and economic growth intrinsically linked. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. Comment summary:

I have been a resident of Marske for thirty years and I am very concerned about the prospect of developing land on the outskirts of the village. I assume that one of the main reasons for this unwanted development is to increase council tax revenue. With unemployment in Redcar and Cleveland currently at 11.9%, what justification is there for building 1000 new homes, particularly on a greenfield site? Can the council guarantee further employment prospects, to attract new people into the area? Following the much needed traffic calming measures recently installed in Marske, has the council considered how the new housing development will lead to unacceptable congestion at the railway bridge, the roundabout in the centre of the village and also at the junction of Longbeck Road, Redcar Road and Churchill Drive? I object to the policy of the Draft Local Plan, which plans to build 1000 homes at Marske Inn Farm.

Officer response:

The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The Council has prioritised the allocation of previously developed land for development. Comment summary:

I must object strongly to the proposed development at Marske, I have grown up in, what used to be a village - the became a larger for the people to work at (ICI). Building more houses turns Marske into a sprawling estate, lacking all the character of country-side and seaside. I still want to see some green fields, I don't want to see - more traffic, more floods, more buildings, I hope this development never comes to happen.

Officer response:

The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. Comment summary:

No need for new housing. The area is losing jobs and population. The N.W. treatment plant in Green Lane has been shown to be inadequate for the current population never mind an extra 3-4000 new residents. Any new large scale development as envisaged by RBC in Wilton site would be largely short-term construction jobs rather than sustainable long term jobs. The consultation exercise by West Midlands Pension Fund was merely a publicity stunt. Why should we be dictated to by an organisation in the Midlands? Traffic congestion is a problem in Marske now. Restricting High Street at the railway Bridge will only make matters worse. As, now retired teachers we are concerned over the demolition of Primary School Buildings in Marske and New Marske and no evidence of replacing these in the future years.

Officer response:

The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The Local Plan seeks to support economic growth and job creation. The plan also seeks to support the key industrial sectors of the port, chemicals, steel, and recycling industries whilst recognising the need to diversify the economy so that it is more resilient to change in the future. The plan also puts policies in place to support small and medium sized business as well as the tourism industry which has the potential for significant growth building upon the natural assets of the borough. House building is also a key economic sector, with housing development and economic growth intrinsically linked. The policy already requires the resolution of water supply, sewerage and drainage requirements including off-site infrastructure enhancements, prior to development taking place. The Council expects developers to carry out a genuine and meaningful consultation with local residents, interest groups and recommended/statutory consultees at an early stage, as set out within the Council's adopted Statement of Community Involvement. However, there is no legal obligation for a developer to undertake pre-application consultation and it can only be encouraged by the Council. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The Council uses detailed school place projections when making decisions on the need for school buildings. Buildings are only cleared where the projections clearly indicate that the buildings are no longer required to meet current and future needs.

Comment summary:

Object to policy due to the following reasons: It transpires that one significant and vested interest party has seriously influenced major parts of the plan over a long period of time and that the council has adjusted its strategic approach as a result of this intervention. The scale of the development does not reflect the character of Marske There are a number of Greenfield sites, which should be developed prior to this site. The site is located on high ground and there are good views from Marske Station, which the development would intrude. There are surface water flooding issues and there is not enough capacity in the existing surface water drains to cater for a large development. The road network will not be able to cope with the additional traffic. The need for this amount of housing in this location has not been evidenced.

Officer response:

The Council has prioritised development on the most sustainable sites to meet identified housing needs, whilst ensuring that sites are viable for residential development and have a realistic prospect of being delivered within the plan period. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 1, which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood

risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy.

Comment summary:

Object to this policy due to the following reasons: Traffic and Safety, Flood risk, The site is a greenfield site, Schools may not be able to cope with the increase in population, The size and scale of the development is completely disproportionate to the size of Marske.

Officer response:

This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The primary school projections show that there will be sufficient surplus capacity within

the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. Whilst it is noted that the scale of the development would be significant, it has been necessary for the Council to identify a strategic housing site of this scale to enable the delivery of a sufficient supply of housing to meet the identified housing needs of the borough across the plan period. After assessing several options in the conurbation area, which is the main focus for employment, population and development within the borough, the site was considered by the Council to present the most sustainable and acceptable option.

Comment summary:

Object to proposed housing development at Windy Hill Lane and Marske Inn Farm. The plan should have been prepared with local people in mind not the developers. Greenfield sites have been chosen instead of brownfield sites because they are more lucrative to developers. Marske cannot take the level of development proposed. The local amenities could not cope. Increased congestion. No access into proposed site. The proposals would encourage pedestrians to walk under the railway bridge where there is no footpath. Development would increase the likelihood flooding which already happens. The consultation by the West Midlands Pension Fund was inadequate. They provided misleading information and did not advertise the second event widely. Commercial proposals have been included whilst these were never part of the consultation proposals. The land is outside the present limits to development and should not be allowed to go ahead.

Officer response:

The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. Only surplus brownfield land at Errington Primary School has been allocated for housing development on Windy Hill Lane under Policy H3.16. No greenfield sites have been allocated for development on Windy Hill Lane. Whilst it is noted that the scale of the development would be significant, it has been necessary for the Council to identify a strategic housing site of this scale to enable the delivery of a sufficient supply of housing to meet the identified housing needs of the borough across the plan period. After assessing several options in the conurbation area, which is the main focus for employment, population and development within the borough, the site was considered by the Council to present the most sustainable and acceptable option. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required to meet needs arising from the development. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Comment summary:

Marske Inn Farm - construction of 700-1000 homes, pub/restaurant, 60 Bed Hotel, Petrol Station, and drive Through Takeaway. The land is owned by the West Midlands Metropolitan Pension Fund. They have a responsibility to their Members to get the maximum financial return, thus resulting in lesser quality site development. This is a Phase I development and it is clear the intention is to develop green agricultural land up to Marske Bye-Pass an incremental development over many years. It will have an adverse impact on the natural environment resulting in increased traffic flows, congestion and site access. This development will result in the erosion of thriving local communities, loss of green space, and loss of identity of Marske/New Marske/Saltburn. It also represents the loss of green amenity and of prime agricultural land, The area is well known to be prone to surface water flooding and run-off. It is doubtful whether the Northumberland Water requirement of water dispersion within the site can be accomplished. The proposal will require substantial local infrastructure of General Practitioners/Clinics/Dentists etc.

Officer response:

The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The site comprises of predominantly Grade 3b land within the Agricultural Land Classification, which is not considered to be the best and most versatile agricultural land. Whilst some of the site is considered to be Grade 3a, it is considered that the loss of these relatively small areas of higher quality agricultural land would be outweighed by the benefits of the development in helping to meet identified housing needs in a sustainable location. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Comment summary:

We strongly object to the proposed development for 1000 houses at Marske Inn Farm. The continuation of building projects adjacent to our village (it is not a town, although it feels like one!) will cause untold misery not only for the residents of Marske but also those in outlying communities. Increased traffic will be problematic as we already have experience of delays caused by excessive numbers of people now commuting to work especially in the rush hour. I avoid these times even though an early start would be convenient for me. Return journeys from 4 o'clock to 7 o'clock are also out of the question. We despair of the loss of countryside around Marske, I understood that there would always be a green belt of land around us, it would appear that the council is ignoring this. Loss of flora and fauna would be disastrous, vast numbers of creatures are already in decline, has no one on the council seen Watership Down ? Increased volume of sewerage is also to be considered, we are concerned about the dangers of pollution. Flooding is an important aspect to consider, recently we had a critical situation as water cascaded down the High Street and collected in low lying areas . It has become particularly difficult since the new pedestrian crossings in the High Street have been installed. Whilst we understand the need to create a safe crossing area, the raised area of tarmac restricts the normal flow of rainwater leaving it to find its level in other areas inevitably creating the threat of flooding to shops and houses to either side. The land proposed for development is a natural soakaway for much of the rainwater coming down from the hills, it therefore seems logical to leave it as it is instead of replacing it with bricks, mortar and concrete.

Officer response:

The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. Accessible open space will also be required as part of the development in accordance with Policy N3. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. The policy has identified that there will need to be a resolution of water supply, sewerage and drainage requirements including off-site infrastructure enhancements to allow the site to come forward for development. The Council will closely liaise with Northumbrian Water to ensure that the proposals are acceptable and would not result in an unacceptable impact upon water quality. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type

and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place.

Strongly object to the proposals. There has been insufficient consultation on the planning application. The Council has not sufficiently considered the impact of the development on infrastructure, schooling and traffic. Do not believe that the Council listens to public opinion.

Officer response:

The Council expects developers to carry out a genuine and meaningful consultation with local residents, interest groups and recommended/statutory consultees at an early stage, as set out within the Council's adopted Statement of Community Involvement. However, there is no legal obligation for a developer to undertake pre-application consultation and it can only be encouraged by the Council. We have undertaken a 6 week consultation on the draft Local Plan. Throughout the consultation period we held a number of drop-in sessions throughout the Borough, including in Marske, where people could discuss the Plan with Council officers. The consultation and drop-in events were advertised on the Council's website, resident's magazine and notification sent to those on our consultation database. The Council will also hold a 6 week consultation on the Publication draft of the Local Plan. Notification will be sent to those on our consultation database to inform them of the consultation, including anyone who has commented on the draft Local Plan. All of our consultation procedures are set out in the adopted Statement of Community Involvement. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required to meet needs arising from the development. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport.

Comment summary:

This is an entirely opportunist proposal that shows no regard for the character of Marske by the sea. Given the scale of the development (the largest site in the Borough), its setting in the landscape and its juxtaposition to Marske, there is no acknowledgement of its enviable impact. The way in which the proposal is discussed suggests muddled thinking. The plan talks of a new community being created to the south of Marske. The plan states "it is north of the A174, which provides a defensible settlement boundary" - yet it is patently obvious that the railway line is the natural southern development boundary of the village. At present the village nestles at a relatively low level that contributes to its character. This new community to the south on higher ground with potentially more than just housing will become a dominant and unattractive feature in the rural corridor to Saltburn and East Cleveland. With the railway no longer a defensible boundary to development it would be hard to resist further continuous ribbon development (east and west) between Redcar and Saltburn, entirely changing the character of the area. The plan states:"Although the A174 will establish a definitive settlement boundary at Marske, the development of the site will inevitably reduce the distance between the built-up areas. Policy N2 requires the retention of a strategic gap between Marske and New Marske. Although the A174 will establish a definitive settlement boundary at Marske, the development of the site will inevitably reduce the distance between the built-up areas."The plan talks of retaining "the separate identity of the two settlements" of New Marske and the new community. What about the identity of Marske? This begs the question about whether this development is a new community or in reality an extension of Marske (as it will be seen), increasing the size of the village by over well 20%. If it were to be promoted as a new community, perhaps the plan should say more about how Marske will be protected from its impact - but of course that is not how it is in practice. Given this reality: increasing the size of Marske by over 20% - there is no recognition / consideration of the consequences, apart from a couple of glib references. This contrasts with all the discussion about Redcar under Policy LS2. It would appear that Marske is intended to meet Redcar's housing needs (and wider housing requirements within the Borough) without much consideration beyond that.

Officer response:

The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. Whilst it is recognised that the proposals would result in a narrowing of the strategic gap between Marske and New Marske, the policy indicates that a deep planting buffer will be provided towards the A174, which will help to reinforce the strategic gap and retain its integrity. The open spaces between Marske and Saltburn, and Marske and Redcar will continue to be protected as a strategic gap and green wedge respectively under Policy N2. It has been necessary for the Council to identify a strategic housing site of this scale to enable the delivery of a sufficient supply of housing to meet the identified housing needs of the borough across the plan period. After assessing several options in the conurbation area, which is the main focus for employment, population and development within the borough, the area to the south of Marske was considered by the Council to present the most sustainable and acceptable option due to its location close to public transport facilities and other services and because it is less constrained by environmental and planning policy considerations.. Within this broad area, the Marske Inn Farm site is considered to be the most sustainable, accessible and developable site option.

Comment summary:

As a long time resident of Marske I strongly object to the local plan proposals particularly with a view to develop the land at Marske Inn farm. Why are the council so intent on destroying what is a lovely village to live in ? Why is another greenfield site being proposed when we have so many brownfield sites available, its another case of losing good arable land. Why have the council extended the development limit to include greenfield sites around Marske without consultation with residents Are the council intent on destroying the character of Marske and why wont you listen to the views of the residents. Marske has its own unique character so why are you intent on destroying it. When did we become classed as part of the conurbation ? We should be looking to keep a strategic gap between New Marske but also Redcar and towards Saltburn, why you seem intent on joining them all up I don't know Given the recent job losses in the area at Tata and at Npower Thornaby I don't see how you can forecast economic growth its pie in the sky stuff and when this is patched together with the proposed continued fall in the area population I cant see why there is a demand for housing to the extent the plan claims. People will not move into the area if there are no jobs, also people will not move here to live in mass sprawling developments. I condemn the plan and all its plans to change the character of the area its time the council listened to the views of the residents

Officer response:

The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The site comprises of predominantly Grade 3b land within the Agricultural Land Classification, which is not considered to be the best and most versatile agricultural land. Whilst some of the site is considered to be Grade 3a, it is considered that the loss of these relatively small areas of higher quality agricultural land would be outweighed by the benefits of the development in helping to meet identified housing needs in a sustainable location. The existing policy framework includes Marske within the conurbation. No changes are being proposed through the Local Plan. There is no green belt designation within Redcar and Cleveland. However, the Local Plan protects green and open spaces as identified on the proposals map and protects the rural area through the establishment of development limits surrounding the main settlements. The space between Marske and New Marske is designated as a strategic gap between the conurbation and rural area under Policy N2. Whilst it is recognised that the proposals would result in a narrowing of the strategic gap between Marske and New Marske, the policy indicates that a deep planting buffer will be provided along the A174, which will help to reinforce the strategic gap and retain its integrity. Accessible open space will also be required as part of the development in accordance with Policy N3. The Local Plan seeks to support economic growth and job creation. The plan also seeks to support the key industrial sectors of the port, chemicals, steel, and recycling industries whilst recognising the need to diversify the economy so that it is more resilient to change in the future. The plan also puts policies in place to support small and medium sized business as well as the tourism industry which has the potential for significant growth building upon the natural assets of the borough. House building is also a key economic sector, with housing development and economic growth intrinsically linked. The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy.

However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The existing policy framework includes Marske within the conurbation. No changes are being proposed through the Local Plan. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The Local Plan seeks to support economic growth and job creation. The plan also seeks to support the key industrial sectors of the port, chemicals, steel, and recycling industries whilst recognising the need to diversify the economy so that it is more resilient to change in the future. The plan also puts

policies in place to support small and medium sized business as well as the tourism industry which has the potential for significant growth building upon the natural assets of the borough. House building is also a key economic sector, with housing development and economic growth intrinsically linked. The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The Local Plan only deals with proposals which affect the Redcar and Cleveland planning area. Proposals for offshore turbines fall outside the Redcar and Cleveland planning area and are determined by the relevant Secretary of State. The Council will respond to any planning applications for offshore wind turbines as a consultee, based on their impact upon the borough and their consistency with policies contained within the Local Plan.

Comment summary:

Objects to the proposals. There are enough brownfield sites that can be used for development instead of this greenfield site. The area is prone to flooding. There are no jobs in this area to support more housing. Surrounding areas must be left green otherwise rural area is lost forever. The proposals would not generate local employment. There are numerous empty properties already available, no need for more. Road network is already congested.

Officer response:

The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. The Council has prioritised development on the most sustainable sites to meet identified housing needs, whilst ensuring that sites are viable for residential development and have a realistic prospect of being delivered within the plan period. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. Policy TA2 also includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport.

It seems to me that Redcar and Cleveland policy regarding development has been dictated to them by Frank Knight on behalf of a private pension fund from outside the area, whose only interest in the area is financial. For all the reasons, by now very well known to the Council, outlined by the Stop The Houses campaign, I strongly object to the proposal to build on Marske Inn Farm. I would like the Council to abide by its own principles as they had agreed them before they were manipulated by Frank Knight, and no doubt others with a vested interest, but whose suggestions on re-wording of Council policy have not seen. What next? Put landlords dictating licensing policy. A friend of mine got a parking fine recently. I wonder if she could suggest a change in the wording of your parking policy so she doesn't have to pay?

Officer response:

Objection noted.

Comment summary:

The Plan as written appears to offer safeguards against the proposed housing developments threatening Marske notably (R/2013/0669/OOM), yet these do not prevent the application being considered. You state that 'There are are areas in the Borough with high demand for housing supporting high price range properties.' This is not the case in Marske since the downturn in local (Wilton and Steelworks) industry. On RightMove alone recently there were 533 houses for sale within a one mile radius of TS11. Northumbrian Water have stated that they can take no further surface run-off water into the existing drains. The proposed are is subject to flooding and development there will threaten existing areas in Marske. There are several brownfield sites close by so why is there a need to use a greenfield site that would destroy the character of Marske? There are NO good reasons to use the proposed area for extra, unwanted, unnecessary housing.

Officer response:

The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. I write again to send my strong objections to you of the proposal to place further housing etc in our village of Marske-by-Sea. My reasons being stated in my previous letter. In my 55 years in this village we never seem to get the funding and consideration of our neighbours. I specifically have asked for a reasonable bus shelter as the end of Hummershill Lane, and still have the letter telling me the Council did recognise it to be the coldest bus stand in Cleveland, but all to no avail, people still stand out in all elements awaiting a very unreliable bus service. No 81, which can be early, late on arrival. Please do consider carefully all the objections put forward. Please ask your Strategic Planning team to think very carefully before taking further action.

Officer response:

The Council's investment decisions are based on the Council's priorities at that point in time, based on the limited resources available. Policy TA3 seeks to improve bus routes, services and passenger facilities. Comments have been passed to the Area Management section regarding the provision of a new bus shelter at the end of Hummershill Lane.

Comment summary:

I strongly object to the proposal to build 1000 new houses ABOVE Marske. The recent floods demonstrated that it would be irresponsible of the L.A to even propose this. Holding tanks would still have to discharge their contents somewhere - or are you relying on evaporation? I have film of the recent floods in Marske & if these conditions occur again 1000 extra houses could only worsen the situation - as well as being under virtually certain risk of flooding themselves - a fact which will not escape the insurance companies. The traffic through Marske is already heavy during rush hours and the railway bridge would be a natural bottleneck if the proposed traffic measures are implemented - the school run being one of the worst times as this proposed new town would not have a school

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand

for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development.

DLP297**Full Name:** Mrs Heather Douglas**Organisation:****Agent Name:****Agent Organisation:****Submission type:** Web**Agree with section?:** No**Comment summary:**

Marske is not a district - it is a village. 1000 new houses would increase the population by 1/3 & put pressure on all local services and infrastructure.

Officer response:

Marske is defined as a District Centre for the purpose of the town centre hierarchy as identified in Policy ED1. It is recognised that the development south of Marske will significantly increase the population of this village; however, it is one of the most sustainable sites within the Borough for new housing development. Contributions will be sought, as necessary, at the time of the application towards any infrastructure requirement, including local education and healthcare provision, transport, open space and community facilities to meet needs arising from the development.

Comment summary:

Dear Sirs, My wife and I wish to register - in the strongest possible terms - our objections to the Policy H 3.1 We believe this plan to be a gross dereliction of the Council's responsibilities to the residents of this town on the grounds that (i) the land was outside development limits for this area and should never have been included either as a draft or policy without a full enquiry into its necessity. The council claims to have a good supply of brownfield sites why then propose the loss of a valuable, arable, greenfield site for housing - much of which will be "executive" and therefore outside the definition of "affordable" housing for most residents; particularly with the well publicised and established negative growth in local population. (ii) We already suffer from water runoff from the high ground to the South of the town when heavy rain occurs; the building of 1000 houses on the this area will remove natural soak away for this rainfall thereby increasing FLOOD RISK to the town lying below the proposed estate - who will be responsible for the clear up when this occurs, certainly not the builders - they will be long gone! Not the council as they will absolve themselves of any responsibility. The proposed SUDS have a poor reputation from their operation in Redcar, over the last 2-3 years and it is apparent that Northumbrian Water Authority cannot guarantee any improved method of coping with the aforementioned runoff. (iii) Traffic impact on the already narrow High Street has and is being totally disregarded - pedestrians are already at risk; the proposed junction south of the railway bridge on the A1085 will simply make a bad situation much worse. This extra traffic entering the village will have to use Redcar Road from the east or come into the village via Longbeck Lane - a road well known in the area for its poor access at the junction with Redcar Road near the Mermaid Pub. (iv) Our schools will - we believe - only cope by cramming more children in classes which will overcrowd the building and class size. The attitude of the council in offering financial contribution to the current schools will hardly allow those same schools to offer the high quality education currently being enjoyed by children in those schools. (v) There will be little benefit to business community in Marske as residents in the new development are too far away from town centre to walk in and will travel by car to Redcar shops or Skelton Asda. (vi) Furthermore as Parking is already at a premium (the main car park is always full for most of the business day and Co-op car park is also well used), further development will compound this already serious situation. (vii) Finally - there has been so little consultation on this whole proposal as to make local democracy a complete joke!. No consideration has been given to change in the proportionality of this development to the current size of Marske, we can only believe it will destroy forever the existing character and atmosphere which has substantially been the reason we have stayed in our present house for some 45 years. I hope and believe the residents of Marske will oppose this proposal by any means they have in their power. Mr J. Prest & Mrs M.Prest

Officer response:

The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The development limit boundaries are being reviewed as part of the process of updating the Local Plan. The existing development limits boundary would be amended to include the site within development limits. The amendment to development limits formed part of the consultation on the Local Plan. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Comment summary:

The site at Marske Inn farm is totally unacceptable for a large scale housing development. All brownfield sites should be used before resorting to greenfields, and whilst there may be a requirement nationally there is no need for this amount of houses locally until employment prospects improve. It will be of no benefit whatsoever to Marske and will only create more problems with schools, traffic and floods. As the Draft Redcar and Cleveland Infrastructure delivery plan September 2013 stated a new primary school on site is unlikely to be viable, yet it also stated existing schools had no space to extend and increased school traffic was an issue. The plan also implied a footpath would be required under the railway bridge reducing the road to a single lane, this would create gridlock into and out of Marske, with traffic backing up to both roundabouts. The Strategic flood risk assessment 2009 stated that there have been several flood issues in Longbeck as well as a groundwater problem in the area. I also think the hotel/pub/drive thru/petrol station idea is a smoke screen designed to take the heat out of the housing development complaints, which will be dropped/modified to pacify at a later stage. If an alternative is required (still not convinced !) developing Redcar racecourse would seem to be a way of keeping houses in town and maintaining the countryside.

Officer response:

The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The Local Plan seeks to support economic growth and job creation. The plan also seeks to support the key industrial sectors of the port, chemicals, steel, and recycling industries whilst recognising the need to diversify the economy so that it is more resilient to change in the future. The plan also puts policies in place to support small and medium sized business as well as the tourism industry which has the potential for significant growth building upon the natural assets of the borough. House building is also a key economic sector, with housing development and economic growth intrinsically linked. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will

be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development.

Comment summary:

Objects to the proposed development. The development is outside development limits. The proposals would destroy good agricultural farmland. Increased traffic congestion. The proposals would result in a disproportionate amount of development for Marske. There is a population decline and therefore no need for this level of housing. Increased traffic on Longbank Road and A1085. There is no pedestrian footway along A1085 under the railway bridge and the increased traffic and numbers of pedestrians/cyclists using this route is likely to result in accidents. Greenfield sites should not be used if there is a good supply of brownfield sites available. Why does the DLP propose to extend development limits at Marske without consultation? Why does the DLP describe Marske as part of the conurbation? Why does the DLP say that Marske is one of many coastal/rural villages that characterise East Cleveland but then propose to destroy this with 1,000 houses. DLP proposes landscaped buffer to reinforce strategic gap to New Marske but this would be better reinforced by not narrowing it. Concerns over flood risk as NWL indicate that no additional water can be discharged into existing infrastructure. Storage tanks cannot be relied upon as the ones on the stray have discharged water onto the beach much more often than was envisaged.

Officer response:

The development limit boundaries are being reviewed as part of the process of updating the Local Plan. The existing development limits boundary would be amended to include the site within development limits. The amendment to development limits formed part of the consultation on the Local Plan. The site comprises of predominantly Grade 3b land within the Agricultural Land Classification, which is not considered to be the best and most versatile agricultural land. Whilst some of the site is considered to be Grade 3a, it is considered that the loss of these relatively small areas of higher quality agricultural land would be outweighed by the benefits of the development in helping to meet identified housing needs in a sustainable location. The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. We have undertaken a 6 week consultation on the draft Local Plan. Throughout the consultation period we held a number of drop-in sessions throughout the Borough, including in Marske, where people could discuss the Plan with Council officers. The consultation and drop-in events were advertised on the Council's website, resident's magazine and notification sent to those on our consultation database. The Council will also hold a 6 week consultation on the Publication draft of the Local Plan. Notification will be sent to those on our consultation database to inform them of the consultation, including anyone who has commented on the draft Local Plan. All of our consultation procedures are set out in the adopted Statement of Community

Involvement. The existing policy framework includes Marske within the conurbation. No changes are being proposed through the Local Plan. Whilst it is recognised that the proposals would result in a narrowing of the strategic gap between Marske and New Marske, the policy indicates that a deep planting buffer will be provided towards the A174, which will help to reinforce the strategic gap and retain its integrity. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place.

Comment summary:

I strongly object to the proposal to build houses etc. at Marske Inn Farm. At the moment, Marske by the Sea has its own distinctive character which would be spoilt by the addition of so many more houses. People who live here now because of that very character will move elsewhere. I am worried about flooding as just recently Marske was effectively cut off for a few hours by flood water. That flooding risk will be worse if there are more houses. There will be traffic jams if lights are put in place at the railway bridge. Also there will be congestion at the Longbeck Rd / Redcar Rd. junction. It is a nbad junction now with Churchill Drive opposite, but will become much worse. Please take into account the opinions of thje majority of the residents of Marske and reject the proposal.

Officer response:

The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. Comment summary:

I strongly object to these plans. These plans will totally destroy the distinctive character of Marske. When there are brownfield sites why destroy greenfield sites for housing. This area is noted for flooding. Northumberland water views are well known on this matter not only would flooding be localised but spread to other parts of Marske. The build up of traffic in the high street and Longbeck Lane areas would be totally unacceptable and create chaos. Once again I strongly object to these plans.

Officer response:

The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. Comment summary:

Development to south of Marske would affect its character considerably. It would exacerbate the existing flooding problems already experienced in Marske. It would have a detrimental affect on the quality of life for the whole of Marske. Despite the Council being willing to promote greener transport it would cause a massive increase in the number of cars commuting in and out of the area, as public transport not a realistic alternative. The Local Plan should concentrate on developing brownfield site and leave our green spaces for our future generations.

Officer response:

The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Comment summary:

Objects to the proposals. There are enough brownfield sites that can be used for development instead of this greenfield site. The area is prone to flooding. There are no jobs in this area to support more housing. Surrounding areas must be left green otherwise rural area is lost forever. The proposals would not generate local employment. There are numerous empty properties already available, no need for more. Road network is already congested.

Officer response:

The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. The Local Plan seeks to support economic growth and job creation. The plan also seeks to support the key industrial sectors of the port, chemicals, steel, and recycling industries whilst recognising the need to diversify the economy so that it is more resilient to change in the future. The plan also puts policies in place to support small and medium sized business as well as the tourism industry which has the potential for significant growth building upon the natural assets of the borough. House building is also a key economic sector, with housing development and economic growth intrinsically linked. The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population

stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Comment summary:

As a resident of Marske, this development will adversely affect my and my family's quality of life in many ways; the environment, education, traffic & safety and healthcare, see below. I wish to very strongly object to the proposed development in Marske. This building work which is proposing on the land at Windy Hill Farm, where there are drainage problems before it is even started. Water stands on that land which is clearly seen from the main road into Marske. The local schools will be bursting at the seams, New Marske Primary, which was amalgamated from two schools the infant and junior school in 2000 with the loss of many school places this was so the land could be sold by the R & C Council and houses built on it. Also Errington School was also amalgamated and the land is up for sale at this moment again the loss of many school places, so where will the children go? Bydales, a fine school, again has been built again and the loss of places there, did not the council envisage this building work was to happen, I do know that the Education department looks many years ahead so were they not consulted about this proposed build when the schools were made so much smaller. The traffic on the High Street will be a terrible headache, as some sort of pathway will have to be made to come under the railway bridge as at the present moment there isn't a footpath there and is dangerous now. Longbeck Lane junction into Marske will have to be sorted, I have used that for many years to my place of work and it has got gradually worse as time ahs moved on so what will it be like at between 08.00 and 08.45, when everybody is trying to get their kids to school. I have lived in Marske for many many years and am totally disgusted with the proposed plan.

Officer response:

Policy SD4 of the Local Plan seeks to ensure that development is designed to a high standard, including ensuring that development will not have a significant adverse impact on the amenities of occupiers of existing or proposed nearby properties. The impact of the development upon residential amenity will be assessed as part of the planning application. The policy indicates that the proposals will be expected to provide a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking account the impact of the development on the landscape. In addition, the policy requires a landscape assessment and appropriate landscaping scheme throughout the site, including a deep planting buffer towards the A174 which reinforces the strategic gap with New Marske. Detailed consideration of the impact of the proposals upon the natural environment will be made as part of the planning application process. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. It is an inevitable consequence of development that the proposals will result in additional traffic. However, the Council has sought to minimise this by locating sites in the most sustainable locations with good access to public transport and close to services and facilities to minimise the need to travel and the distance travelled. It is considered that the site is located in a sustainable location adjacent to two railway stations on the Saltburn to Darlington line and in relative close proximity to a range shops, services and community facilities. Policy TA2 also includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. Only surplus brownfield land at Errington Primary School has been allocated for housing development on Windy Hill Lane under Policy H3.16. No greenfield sites have been allocated for development on Windy Hill Lane.

Comment summary:

The plan focuses primarily on Greenfield sites, rather than brownfield. It will reduce the appeal of our area. The extra housing is driven by developers rather than by demand. The type of housing on the main site, will predominantly have four bedroom detached houses on it. This is what the developer will look to build. These houses will not improve home ownership in the area. Brownfield sites developed in other areas of the borough such as Redcar and Greater Eston will enable smaller homes and homes more affordable to first time buyers. The problem is that developers won't make as their money in these areas so they are not as interested. Since 2006, agents working on behalf of the land owners of the South of Marske site have lobbied for development limits to be changed to the south of Marske. The proposals will cause great flooding issues in Marske if developed. The fact the whole local plans economic future rests on such a fanciful development is disturbing. The rural conurbation of Marske will be altered in both character and value. It is likely higher earners will move into Yorkshire away from Redcar and Cleveland due to the increased traffic congestion from this development. The Local Plan and the Economic Masterplan before it fail to mention high-tech or niche industry. They don't offer any alternative to the large industrial decline. The notion of creative industries has already failed in Redcar it doesn't offer enough money to purchase the kind of properties mentioned in the plan.

Officer response:

The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The Tees Valley 2012 Strategic Housing Market Assessment (SHMA) provides the most up-to-date assessment of housing needs and aspirations in the borough and has been used to inform the policies within the plan. The plan overall seeks to meet the range of housing needs for different types of market and social housing, including increasing the supply of larger detached dwellings. The policy indicates that the development will be expected to provide a broad and appropriate housing mix, including the provision of affordable housing on-site. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The development limit boundaries are being reviewed as part of the process of updating the Local Plan. The existing development limits boundary would be amended to include the site within development limits. The amendment to development limits formed part of the consultation on the Local Plan. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas

most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. The Local Plan seeks to support economic growth and job creation. The plan also seeks to support the key industrial sectors of the port, chemicals, steel, and recycling industries whilst recognising the need to diversify the economy so that it is more resilient to change in the future. The plan also puts policies in place to support small and medium sized business as well as the tourism industry which has the potential for significant growth building upon the natural assets of the borough. House building is also a key economic sector, with housing development and economic growth intrinsically linked. The Economic Development section of the Local Plan seeks to support all aspects of the economy, including high tech and niche industries. Policy ED6 indicates that high tech and knowledge driven development should be focused at Kirkleatham Business Park and Cleveland Gate Business Park. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport.

Comment summary:

We strongly object to the proposed development for 1000 houses at Marske Inn Farm. The continuation of building projects adjacent to our village (it is not a town, although it feels like one!) will cause untold misery not only for the residents of Marske but also those in outlying communities. Increased traffic will be problematic as we already have experience of delays caused by excessive numbers of people now commuting to work especially in the rush hour. I avoid these times even though an early start would be convenient for me. Return journeys from 4 o'clock to 7 o'clock are also out of the question. We despair of the loss of countryside around Marske, I understood that there would always be a green belt of land around us, it would appear that the council is ignoring this. Loss of flora and fauna would be disastrous, vast numbers of creatures are already in decline, has no one on the council seen Watership Down ? Increased volume of sewerage is also to be considered, we are concerned about the dangers of pollution. Flooding is an important aspect to consider, recently we had a critical situation as water cascaded down the High Street and collected in low lying areas . It has become particularly difficult since the new pedestrian crossings in the High Street have been installed. Whilst we understand the need to create a safe crossing area, the raised area of tarmac restricts the normal flow of rainwater leaving it to find its level in other areas inevitably creating the threat of flooding to shops and houses to either side. The land proposed for development is a natural soakaway for much of the rainwater coming down from the hills, it therefore seems logical to leave it as it is instead of replacing it with bricks, mortar and concrete.

Officer response:

The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. Accessible open space will also be required as part of the development in accordance with Policy N3. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. The policy has identified that there will need to be a resolution of water supply, sewerage and drainage requirements including off-site infrastructure enhancements to allow the site to come forward for development. The Council will closely liaise with Northumbrian Water to ensure that the proposals are acceptable and would not result in an unacceptable impact upon water quality. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type

and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place.

Comment summary:

Policy H3.1: The proposed development is not in keeping with the village of Marske and will alter it out of all recognition. The proposal submitted is very different from that which the public were consulted on during 2012. There are already 5 public houses and 2 clubs in Marske, there is no need for additional licensed premises, there is already a petrol filling station on Longbeck lane and another at the Marske end of Saltburn, this is adequate. There is inadequate pedestrian access from the new development to the existing village amenities, a totally new crossing of the railway would be required and Network Rail cannot be expected to contribute towards this, indeed they should require considerable compensation for the disruption it would cause. The proposals for making a footpath under the existing railway bridge on the A1085 by installing traffic light controlled alternating traffic are, frankly, ridiculous. Such a move would cause considerable delays. At peak periods it can already involve a considerable wait to find a gap in the traffic to get from the station approach to Meadow Road. I understand that the current waste water system in Marske is not capable of economic expansion to accept the proposed development and that the geology of the land is unsuitable for a soil infiltration based drainage system. There would therefore be a very real risk of exacerbating the flooding problems that can occur in the area at times of heavy rainfall. The field immediately to the south of Longbeck level crossing demonstrates this point well. Because of the foregoing, it is my firm belief that the southern development boundary of Marske should remain alongside the railway line. The land to the south is good arable land which we require to remain for agricultural production.

Officer response:

The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The Council expects developers to carry out a genuine and meaningful consultation with local residents, interest groups and recommended/statutory consultees at an early stage, as set out within the Council's adopted Statement of Community Involvement. However, there is no legal obligation for a developer to undertake pre-application consultation and it can only be encouraged by the Council. The policy seeks to deliver a strategic housing site for up to approximately 1,000 dwellings, supporting community facilities, infrastructure and public open space. The Policy does not propose a hotel, pub/restaurant, drive-thru restaurant or petrol filling station. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The policy already requires the resolution of water supply, sewerage and drainage requirements including off-site infrastructure enhancements, prior to development taking place. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take

place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. The site comprises of predominantly Grade 3b land within the Agricultural Land Classification, which is not considered to be the best and most versatile agricultural land. Whilst some of the site is considered to be Grade 3a, it is considered that the loss of these relatively small areas of higher quality agricultural land would be outweighed by the benefits of the development in helping to meet identified housing needs in a sustainable location.

Comment summary:

As a resident of Marske for the last 17 years I wish to object in the most strongest terms possible, to the proposed housing developments at Mill Farm Inn and Windy Hill Farm. Main Street which already very busy and is frequently congested from the Railway bridge to the island will be impossible. More houses = more cars. Parking within the centre of Marske is not enough to meet current demands " if visiting the library/ Doctors/ Dentist it is often impossible to find a space. More houses = even more demand for limited parking places. Building will create more potential for flooding with the related impact on insurance premiums etc Marske is not big enough to absorb the extra people the proposed development would bring into the area. As a resident of Marske, this development would adversely affect my family's quality of life in many ways; the environment, traffic & safety and place an unacceptable addition strain on local services.

Officer response:

Only surplus brownfield land at Errington Primary School has been allocated for housing development on Windy Hill Lane under Policy H3.16. No greenfield sites have been allocated for development on Windy Hill Lane. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. Contributions will be required, as necessary, at the time of the application towards any infrastructure requirement, including car parking to meet needs arising from the development. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. Comment summary:

Having read the Draft Local Plan, there are several good points attempting to regenerate East Cleveland over the next 15 years, however, some aspects do not seem to consider the opinion of the residents. As a Marske resident, the point that came to my attention is the plan for a development south of Marske, at Marske Inn Farm. There are several points that make this a bad idea, a few are as follows: 1) Marske is a flood prone area, and any proposed development can only make this worse - who would be liable for further flooding problems if the development goes ahead? The developers? The Council? The following clips show how bad the area floods without additional concrete surfaces and housing, the first one being Marske High Street: <http://www.youtube.com/watch?v=j8lgXaxh5-I> This one is the A174 Marske bypass close to where the development is proposed: http://www.youtube.com/watch?v=2_oy1vbUQxl (Preview) There is no proof that Sustainable Urban Drainage will prevent big problems in the future. Several houses north of the railway line flooded recently, with the rainwater coming from the saturated fields which the development would be on. 2) People choose to live in Marske as it is a village, with a village community. The new development is unlikely to contribute Marske's community and economy as it is so far out of Marske. The people of Marske do not want to be joined onto an urban sprawl - the green fields between Marske, New Marske and Saltburn maintain a village identity. In fact the DLP states that Marske has always maintained its own distinctive character - any plans to expand Marske to the area identified would destroy this character. 3) Access to Marske via both Longbeck Lane and the A1085 is limited already, and any further housing will lead to traffic congestion in and out of Marske. 4) Marske has in recent years seen expansion of Redcar on the Wheatlands and Mickledales estates whereby it is now separated only by a few yards. With other brown field sites available nearby, why is there a need to destroy our green space between the individual coastal villages? 5) There is little evidence of a real requirement for the new housing, since the population of the area is in decline. The local employment at the likes of Wilton site are now subject to the whim of multi-national corporates who could shut down and leave the area if they consider this inefficient. Whilst I wish to see this area prosper, there is no sound evidence from the council where any job growth and hence population growth will come from. These are just a few points highlighting real rationale why not to develop this particular area, and it appears that the DLP has not solicited any local opinion from Marske residents - this really must be addressed before any plans are passed.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The Local Plan seeks to support economic growth and job creation. The plan also seeks to support the key industrial sectors of the port, chemicals, steel, and recycling industries whilst recognising the need to diversify the economy so that it is more resilient to change in the future. The plan also puts policies in place to support small and medium sized business as well as the tourism industry which has the potential for significant growth building upon the natural assets of the borough. House building is also a key economic sector, with housing development and economic growth intrinsically linked.

Comment summary:

Being a Marske resident of the adjoining estate north of the proposed siting of the housing development, I strongly object to the said development and I am seriously concerned as to the effects that building works will have on the drainage of surface water which will surely be too much for the existing drainage system at present. What has been done to address the problem? How will the surface water be drained away safely from existing properties such as mine to prevent flooding the area during and after construction. Regarding the scale of the housing development, I fail to see how 1000 extra houses, most of which cannot be sold, due mainly to lack of employment opportunities in the area, can benefit anybody who resides here in Marske. Also medical centres and schools are bursting at the seams, the road system in Marske centre is overloaded with traffic now so it will grid lock if this development goes ahead. Also access onto Longbeck Road will be a big problem. Where are all these extra people going to work? There is very little employment in the area. I believe Wilton was mentioned by the Council, I find this obviously ridiculous to think that is going to make any difference. I chose to live in Marske because of its history and green space surrounding, this development will ruin Marske if it goes ahead against the wishes of the existing residents, and we all know that it is being pushed along for pure monetary gain by certain individuals within Redcar Cleveland Council who are treating residents with contempt.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 4, which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. Comment summary:

Object to the Draft Local Plan regarding how it would affect Marske for the following reasons: brownfield sites should be used first; Marske should not be in the conurbation; there are not enough jobs to support the amount of housing; the amount of housing proposed is not needed; impact on village character; impact on environment; impact on tourism; traffic; lack of infrastructure; drainage issues; impact on conservation area; loss of habitat and biodiversity; impact on strategic gap; impact on views of countryside.

Officer response:

The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. We have undertaken a 6 week consultation on the draft Local Plan. Throughout the consultation period we held a number of drop-in sessions throughout the Borough, including in Marske, where people could discuss the Plan with Council officers. The consultation and drop-in events were advertised on the Council's website, resident's magazine and notification sent to those on our consultation database. The Council will also hold a 6 week consultation on the Publication draft of the Local Plan. Notification will be sent to those on our consultation database to inform them of the consultation, including anyone who has commented on the draft Local Plan. All of our consultation procedures are set out in the adopted Statement of Community Involvement. The Council has prioritised development on the most sustainable sites to meet identified housing needs, whilst ensuring that sites are viable for residential development and have a realistic prospect of being delivered within the plan period. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. Policy TA2 also includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The policy indicates that the proposals will be expected to provide a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking account the impact of the development on the landscape. In addition, the policy requires a landscape assessment and appropriate landscaping scheme throughout the site, including a deep planting buffer towards the A174 which reinforces the strategic gap with New Marske. Detailed consideration of the impact of the proposals upon

the natural environment will be made as part of the planning application process. It is an inevitable consequence of development that the proposals will result in additional traffic. However, the Council has sought to minimise this by locating sites in the most sustainable locations with good access to public transport and close to services and facilities to minimise the need to travel and the distance travelled. It is considered that the site is located in a sustainable location adjacent to two railway stations on the Saltburn to Darlington line and in relative close proximity to a range shops, services and community facilities. Policy TA2 also includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. Due to the physical and visual separation of the site from Marske Conservation Area provided by the railway line, it is considered that the development is unlikely to have an adverse impact upon the conservation area. However, the proposals will be assessed against Policy HE1 as part of the planning application process to ensure that any impacts are acceptable. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. Whilst it is recognised that the proposals would result in a narrowing of the strategic gap between Marske and New Marske, the policy indicates that a deep planting buffer will be provided towards the A174, which will help to reinforce the strategic gap and retain its integrity. The potential impact of the Local Plan on the loss of a view is not a material planning consideration and therefore cannot be taken into consideration in the preparation of the plan.

Comment summary:

We wish to object to the Draft Local Plan for the following reasons; Our main concern is the increased flood risk as Northumbrian Water states that existing drains are at full capacity and storage tanks are going to have to be used. Existing tanks on The Stray failed to work in the recent flash flood and some properties very close to us suffered horrific flooding. Marske by Sea is very susceptible to rainwater flooding as stated in the British Geological Survey. Traffic. There will be increased traffic in the High Street due to the narrow roads, also at the junction of Redcar Road and Churchill Drive where the existing traffic at rush hours is unbearable. Education. Existing schools in Marske and New Marske will be up to capacity by 2018 and there are no plans to build new schools. Housing. Due to the collapse of the housing market and downturn of the economic situation new housing is not required. The proposed development of the housing does nothing to enhance the character of Marske by Sea.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand

for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. Comment summary:

Object to proposed housing site. Need arable land and greenfield land around Marske. Marske should be kept as a rural village. The plans will cause flooding, extra traffic, congestion and overcrowding in schools and doctors surgeries. Use brownfield land for development.

Officer response:

The site comprises of predominantly Grade 3b land within the Agricultural Land Classification, which is not considered to be the best and most versatile agricultural land. Whilst some of the site is considered to be Grade 3a, it is considered that the loss of these relatively small areas of higher quality agricultural land would be outweighed by the benefits of the development in helping to meet identified housing needs in a sustainable location. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable,

subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required to meet needs arising from the development.

Comment summary:

I would like to express my concern and objection to the proposed development of a green field site on the outskirts of Marske. I bullet point my concerns below:- Why is a greenfield site being used for development? Use the brownfield sites. Allow nature to flourish around the borders of Marske. We are a small coastal town, with a village community. We don't want to be a part of another larger town. Allow us to preserve our own identity and character. We don't need to be bigger to be better. - The same applies to Saltburn & New Marske, I am sure they too would like to maintain their own unique distinctive characters. - Think about the wildlife, their habitat. Why can't the land be farmed? We don't want to lose yet another piece of farmland to development. - Why do we need new houses? And executive ones at that. We are an area which is struggling with employment, unfortunately we can no longer rely on Wilton or British Steel -no jobs means a reduction in population. - There is a real problem in this area with flooding. Water off the hills, comes down from New Marske and heads for Marske. This area of land is regularly under water. The amount of water pouring off it and on the roads is a sight to be seen. What happens if you build on it? Where is the water going to go? The existing drains are already struggling. - Traffic congestion. 1000 more houses could equal 2000 more cars in that area. Marske High Street and Longbeck Lane are already congested. The junction at Redcar Road / Churchill Drive is a nightmare at the best of times. - No new school in the proposed development! Two very good primaries will be oversubscribed. Bydales will also struggle. Why should children from Marske be expected to go further afield for their education? Leaving friends. Getting buses etc. Having to travel any distance will affect the quality of their education, missing out on the extras of school life, particularly after school clubs. I like Marske, just as it is. We are very lucky. The fabulous Stray. Our glorious beach. Cliff tops and fields which stop us becoming part of other villages. Being separate from New Marske is important, it is good to see the "gap" between us and it is important that this "gap" remains "a green and pleasant one". Our environment is glorious, don't destroy it by covering it in bricks and mortar. Housing is not the facelift we need, it will not make us more attractive, we are perfect just as we are.

Officer response:

The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The Local Plan seeks to support economic growth and job creation. The plan also seeks to support the key industrial sectors of the port, chemicals, steel, and recycling industries whilst recognising the need to diversify the economy so that it is more resilient to change in the future. The plan also puts policies in place to support small and medium sized business as well as the tourism industry which has the potential for significant growth building upon the natural assets of the borough. House building is also a key economic sector, with housing development and economic growth intrinsically linked. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. Whilst it is recognised that the proposals would result in a narrowing of the strategic gap between Marske and New Marske, the policy indicates that a deep planting buffer will be provided towards the A174, which will help to reinforce the strategic gap and retain its integrity. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from

main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. Comment summary:

I wish to object to the proposed housing developments at Marske. The population in this area is not increasing and at present there are over 500 properties for sale in the TS11 postcode area. If housing is provided for another 3000 to 4000 residents where are they going to find work in an area of high unemployment? Additionally the development area is prone to flooding. Please refer to the British Geological Survey Groundwater Flood Risk Susceptibility Map for the area. 'Reclaiming and reusing derelict land. Marske has always maintained its own distinctive character'. This would be completely compromised by your Housing Plan, not just to the detriment of Marske, but to the detriment of the whole of East Cleveland. Before any development on this scale is allowed to take place you need to ensure that the existing housing stock is saleable, new stock is built on brownfield sites and there is DEMAND for this sustained by new jobs. ONS stats show that unemployment in R&C is running at 11.9%. Also the congestion problems have not been considered with regard to getting in and out of Marske or along the single carriageway from Saltburn towards Redcar, or the congestion issue that your planned single carriageway at Marske railway bridge will inevitably create. At peak times the junction of Longbeck and Marske Road creates congestion as it is now before any further development takes place. Increased primary and secondary school capacity In Marske and New Marske would be required which appears not to have been addressed. Marske which is a village with its own character which is under threat by this development and will just become part of a further urban sprawl and loss of countryside. Please remember that as a council you are there to represent and work on behalf of residents and the electorate. Any actions taken against their wishes are both arrogant and undemocratic.

Officer response:

The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been

necessary to allocate some greenfield sites in order to meet identified housing needs. The Council has prioritised development on the most sustainable sites to meet identified housing needs, whilst ensuring that sites are viable for residential development and have a realistic prospect of being delivered within the plan period. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. Policy TA2 also includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. Accessible open space will also be required as part of the development in accordance with Policy N3.

Comment summary:

Object to proposed development. It is outside development limits and in a strategic gap. The scale of the development is disproportionate to the size of Marske. The population of Redcar & Cleveland is declining so why are 1,000 houses needed here? It will not create population retention but will create a dormitory town adjacent to, but not connected to Marske. Impact on wildlife. Why haven't brownfield sites been assessed as an alternative? Concerns over flood risk. Only the land owner will benefit and not the residents of Marske. Go back to policy of developing brownfield sites in preference to greenfield sites. Remove Marske from the conurbation area. Contradiction in the plan by saying that Marske has its own identity, but then including it within an area of urban sprawl. Land should be preserved as agricultural land. The DLP should embrace the principal of local government for local people.

Officer response:

The development limit boundaries are being reviewed as part of the process of updating the Local Plan. The existing development limits boundary would be amended to include the site within development limits. The amendment to development limits formed part of the consultation on the Local Plan. Whilst it is recognised that the proposals would result in a narrowing of the strategic gap between Marske and New Marske, the policy indicates that a deep planting buffer will be provided towards the A174, which will help to reinforce the strategic gap and retain its integrity. Whilst it is noted that the scale of the development would be significant, it has been necessary for the Council to identify a strategic housing site of this scale to enable the delivery of a sufficient supply of housing to meet the identified housing needs of the borough across the plan period. After assessing several options in the conurbation area, which is the main focus for employment, population and development within the borough, the site was considered by the Council to present the most sustainable and acceptable option. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The existing policy framework includes Marske within the conurbation. No changes are being proposed through the Local Plan. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The site comprises of predominantly Grade 3b land within the Agricultural Land Classification, which is not considered to be the best and most versatile agricultural land. Whilst some of the site is considered to be Grade 3a, it is considered that the loss of these relatively small areas of higher quality agricultural land would be outweighed by the benefits of the development in helping to meet identified housing needs in a sustainable location.

Comment summary:

I register my objection to the Draft Local Plan. I can be more expansive in my reply if required at a later date. 1. Lack of appropriate development strategy. The plan focuses primarily on Greenfield sites, rather than greenfield. It will reduce the appeal of the area. The extra housing is driven by developers rather than demand. The type of housing on the main strategic site, South Marske, will have predominantly have four bedroom detached houses on it. This is what the developer will look to build. These houses won't improve home ownership in the area. Brownfield sites developed in other areas of the borough such as Redcar and Greater Eston will enable smaller homes and homes more affordable to first time buyers. The problem is that developers won't make as much money in these areas so aren't interested. Since 2006 agents working on behalf of the land owners of the South of Marske site have lobbied for development limits to be changed to the south of Marske. Despite lack of need, the areas population is shrinking, officers and councillors are capitulating to the demands of this land owner. That site will cause immense flood problems in Marske if developed. The houses built on the site itself will likely be uninsurable. The fact the whole local plans economic future rests on such a fanciful development is alarming. The rural conurbation of Marske will be altered in character and value. It is likely higher earners will move into Yorkshire away from Redcar and Cleveland due to the increased traffic congestion from this development.

Officer response:

The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The Tees Valley 2012 Strategic Housing Market Assessment (SHMA) provides the most up-to-date assessment of housing needs and aspirations in the borough and has been used to inform the policies within the plan. The plan overall seeks to meet the range of housing needs for different types of market and social housing, including increasing the supply of larger detached dwellings. The policy indicates that the development will be expected to provide a broad and appropriate housing mix, including the provision of affordable housing on-site. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already

recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement.

DLP416**Full Name:** Steven Jones**Organisation:****Agent Name:****Agent Organisation:****Submission type:** E-Mail**Agree with section?:** No**Comment summary:**

Regarding the above development proposal I wish to object to this for the following reasons, and also fail to understand why we, the local residents, have not been consulted. I have only learned of this proposal from the local Liberal Democrats. And whilst I knew nothing about it, apparently you had a 'drop in' meeting at Guisborough? Hardly local. I do believe the proposed development would cause severe problems for the existing residents of this estate. I believe most strongly that the loss of green space, loss of privacy, traffic increasing on already congested small roads, quite apart from the noise, would be disastrous. I would also wonder why any new development cannot be built on existing brown field sites? Why is the Council considering building on Greenfield sites outside of the development limits? I also feel that the following points are of note: that this would be a loss of green space used by local residents for recreation and dog walking and that it would mean a loss of privacy to a greater number of residents. I also feel that the local network of roads is already overloaded and that this site would greatly increase traffic congestion and reduce road, and pedestrian, safety. The existing roads are bad enough, and especially in the winter, downright dangerous. An increase of an estimated 500 cars along these roads would be a disaster. On these grounds, I strongly object to these, and to any future planning applications that may be submitted and would appreciate a response to the points made above.

Officer response:

We have undertaken a 6 week consultation on the draft Local Plan. Throughout the consultation period we held a number of drop-in sessions throughout the Borough, including in Marske, where people could discuss the Plan with Council officers. The consultation and drop-in events were advertised on the Council's website, resident's magazine and notification sent to those on our consultation database. The Council will also hold a 6 week consultation on the Publication draft of the Local Plan. Notification will be sent to those on our consultation database to inform them of the consultation, including anyone who has commented on the draft Local Plan. All of our consultation procedures are set out in the adopted Statement of Community Involvement. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. Accessible open space will also be required as part of the development in accordance with Policy N3. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The development limit boundaries are being reviewed as part of the process of updating the Local Plan. The existing development limits boundary would be amended to include the site within development limits. The amendment to development limits formed part of the consultation on the Local Plan.

Comment summary:

I would like to lodge a formal objection to the proposed development at Marske by the Sea in the Local Draft plan. The reasons being:- (1) The area of the proposed development is a natural attenuation tank this reduces the amount of flooding in Marske. There has been two incidents of flooding in the Longbeck area and the High Street in the past 10 months. The development will considerably make the flooding situation worse. The proposed holding tanks, soak away and permeable paths will be of limited value if, the area was urbanised as per the planning application. Can the developers demonstrate in view, of the erratic weather conditions that now occur, that the urbanisation of the area and the planned soak aways will improve the flooding situation Marske? Can they guarantee that the natural attenuation will be less the flooding risk, using soak ways etc? Who is to maintain the facilities that are proposed? These facilities trap hazardous contaminants that are entrained by the surface water. Northumbria Water have publically stated that the water courses that the soak ways would discharge to are at capacity. The situation will occur when the soak aways are overloaded and will flood into the COMBINED SEWER system. Many manholes leak throughout Marske in public areas and private dwellings this development will compound the problems. This will have an affect on bathing water quality (B.W.Q) at Marske Sands. Redcar and Cleveland B.C. have put notices at Marske Sands to warn the public about the event of raw sewage being discharged on the beach area. (2) A road bypass was put in to relieve the traffic at Marske many years ago. Is the planning application going to compound an already congested Marske and resulting in tragic and associated car pollution and road safety issues? (3) There will be a considerable increase in the school population at all levels. Initially, the original plans discussed building a school. The proposal from West Midlands Pension Fund (W.M.P.F) says that a financial contribution will be made to Redcar & Cleveland B.C., what happens when the money is spent, the pupils of Marske still have to be educated within a higher school population. Can this be a sustainable example of social gain for the next generation of Marske children? (4) There are many empty houses within the area of the type proposed. Do the residents of Marske need more houses? The supply of houses exceeds demand! Are the council in favour of increases demand that is not there? (5) The area needs sustainable economic development to stimulate demand within the area not empty houses. This does not appear to be an area of success on behalf of the council. At a recent consultation meeting with council officers it was implied that the jobs would be created at the Wilton site, jobs are being shed here! (6) The proposed development will considerably affect the quality of life of the residents of Marske in many ways for young and old e.g the strain on G.P. healthcare. I would be grateful, if you will take into count these issues that I have raised in this objection letter, into your local development plan process.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The policy has identified that there will need to be a resolution of water supply, sewerage and drainage requirements including off-site infrastructure enhancements to allow

the site to come forward for development. The Council will closely liaise with Northumbrian Water to ensure that the proposals are acceptable and would not result in an unacceptable impact upon water quality. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The Local Plan seeks to support economic growth and job creation. The plan also seeks to support the key industrial sectors of the port, chemicals, steel, and recycling industries whilst recognising the need to diversify the economy so that it is more resilient to change in the future. The plan also puts policies in place to support small and medium sized business as well as the tourism industry which has the potential for significant growth building upon the natural assets of the borough. House building is also a key economic sector, with housing development and economic growth intrinsically linked. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is

greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required to meet needs arising from the development.

Comment summary:

Object to development for the following reasons: the consultation was inadequate; the plan does not prevent the application being considered; there is no housing need; there will be a large impact on village character; traffic impact; flooding issues; there are no jobs to support the development; this is greenfield land; the site is on within a Strategic Gap; impact on local services; brownfield sites should be used first.

Officer response:

We have undertaken a 6 week consultation on the draft Local Plan. Throughout the consultation period we held a number of drop-in sessions throughout the Borough, including in Marske, where people could discuss the Plan with Council officers. The consultation and drop-in events were advertised on the Council's website, resident's magazine and notification sent to those on our consultation database. The Council will also hold a 6 week consultation on the Publication draft of the Local Plan. Notification will be sent to those on our consultation database to inform them of the consultation, including anyone who has commented on the draft Local Plan. All of our consultation procedures are set out in the adopted Statement of Community Involvement. The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for

groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. Whilst it is recognised that the proposals would result in a narrowing of the strategic gap between Marske and New Marske, the policy indicates that a deep planting buffer will be provided towards the A174, which will help to reinforce the strategic gap and retain its integrity. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs.

I would like say do you think the TWO rather catastrophic floods in Saltburn was an act of god?..... Personally if you do then you should remove yourselves from any other planning....I have been involved in Saltburn since I was 1 years old ...so since 1959 and never ever has it been so bad...the 1963/64 winter did not create such devastation .As Planners surely, and I say this with hand on heart, surely you looked at rain fall, or snow fallwe are on the edge of a huge North Yorkshire Moor.....Skelton is a high point....who the hell thought sticking hundreds of houses in the midst of a natural moor drainage thought there wouldn't be consequences...and it's not going to get any better unless you put massive drain tunnels straight to the sea. I know you want to sell of land and pension people wish to sell but for god sake be sensible...we are on a massive MOOR, which Mother Nature dictates, not us! You have to think about seriously taking out further fields for development...because I will say YOU have created a massive problem building Skelton and if you carry on you will destroy a great deal more - communities!

Comment summary:

I strongly object to the proposed housing development to the South of Marske-by-the-sea which is contained in your Draft Local Plan document. I fail to see why it is necessary to build on green belt land when so many brown field sites are available, especially with a falling population as stated in your own document. The proposed development will be a blight on the landscape and increase the flood risk on an already vulnerable area. I am yet to meet anyone who thinks this is a good idea and in my view the scheme is being pushed through by the local Council for their own benefit with increased Council Taxes etc. I have to commute to work along the bypass everyday and the traffic is already ridiculous. How will 1000 extra homes improve this situation? The beauty of living in Marske is the "village feel" to the place. This will be completely lost if this development is given the green light with the population set to increase by over a third. I strongly urge you to reconsider this development.

Officer response:

The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. Comment summary:

Please note my strong objection to the DLP for land at Marske Inn Farm! 1. Why not use brownfield sites, there is a good supply of these. 2. Loss of highly productive arable land in times of high food prices. 3. Our village will become a part of a huge urban sprawl. 4. Who will buy them when unemployment is already at 11.9 % in this area. 5. The population of the area is in decline because there are no jobs. 6. People won't move to an area that has no job prospects. 7. A ghost estate could be made, with empty houses no one can afford to live in because there are no jobs to fund them. 8. Significant increase of flooding in an area already prone to such. 9. Increased traffic congestion and delay in emergency vehicles gaining access to our village. 10. Overcrowding in our schools. I could go on ad nauseum, but won't. Make note of my strong objection to this absurd DLP that Redcar and Cleveland council propose.

Officer response:

The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The site comprises of predominantly Grade 3b land within the Agricultural Land Classification, which is not considered to be the best and most versatile agricultural land. Whilst some of the site is considered to be Grade 3a, it is considered that the loss of these relatively small areas of higher quality agricultural land would be outweighed by the benefits of the development in helping to meet identified housing needs in a sustainable location. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The Local Plan seeks to support economic growth and job creation. The plan also seeks to support the key industrial sectors of the port, chemicals, steel, and recycling industries whilst recognising the need to diversify the economy so that it is more resilient to change in the future. The plan also puts policies in place to support small and medium sized business as well as the tourism industry which has the potential for significant growth building upon the natural assets of the borough. House building is also a key economic sector, with housing development and economic growth intrinsically linked. The Council has allocated sufficient sites to meet its objectively assessed housing needs. Comment summary:

Object to development for the following reasons: Marske should not be in the conurbation; the site is outside development limits; environmental impact; not enough local open space; flooding issues; traffic impact; the need for affordable housing; impact on strategic gap; lack of current mortgage finance; impact on village character; there is no need for this amount of housing; there are no jobs; brownfield sites should be selected first; the site is good agricultural land; not enough school places, impact on village identify; and impact on biodiversity.

Officer response:

The existing policy framework includes Marske within the conurbation. No changes are being proposed through the Local Plan. The development limit boundaries are being reviewed as part of the process of updating the Local Plan. The existing development limits boundary would be amended to include the site within development limits. The amendment to development limits formed part of the consultation on the Local Plan. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. Accessible open space will also be required as part of the development in accordance with Policy N3. The policy identifies the site as a strategic development site for up to approximately 1,000 dwellings, supporting community facilities, infrastructure and public open space. The site will therefore contain a number of facilities which residents will require to meet most of their day to day needs. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. Significantly more is needed about the archaeological requirements at this site. It is likely in our opinion that archaeological remains will be present outside of the scheduled area, to the west (and will need to be the subject of prior evaluation). It is also important that the future of the scheduled monument is considered as an integral part of the development at the design stage (not just screened from it); also that long term maintenance and presentation of the monument is secured by any approved scheme.

Officer response:

The policy will be amended to include more information on the archaeological requirements, including the need to undertake a prior evaluation of archaeological remains on the site. Reference has been made in the policy with regard to the need to agree a package of measures to conserve and enhance the appreciation and understanding of the scheduled monument. The Council will work closely with English Heritage to ensure that the impact of the development upon the scheduled monument would be acceptable and that its future is secured.

Comment summary:

Object to the proposals. The site is prone to surface water flooding and the proposals would exacerbate this problem. Increased traffic congestion. Increased pressure on local services and infrastructure, including local schools and health centres. There has been insufficient consultation on the proposals. The site is arable land which could be home to wildlife and birdlife. The area has already been over-developed and the development would ruin the character of this traditional North Yorkshire fishing village.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required

to meet needs arising from the development. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement.

Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required

to meet needs arising from the development. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The Council expects developers to carry out a genuine and meaningful consultation with local residents, interest groups and recommended/statutory consultees at an early stage, as set out within the Council's adopted Statement of Community Involvement. However, there is no legal obligation for a developer to undertake pre-application consultation and it can only be encouraged by the Council. We have undertaken a 6 week consultation on the draft Local Plan. Throughout the consultation period we held a number of drop-in sessions throughout the Borough, including in Marske, where people could discuss the Plan with Council officers. The consultation and drop-in events were advertised on the Council's website, resident's magazine and notification sent to those on our consultation database. The Council will also hold a 6 week consultation on the Publication draft of the Local Plan. Notification will be sent to those on our consultation database to inform them of the consultation, including anyone who has commented on the draft Local Plan. All of our consultation procedures are set out in the adopted Statement of Community Involvement. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. The policy seeks to deliver a strategic housing site for up to approximately 1,000 dwellings, supporting community facilities, infrastructure and public open space. The Policy does not propose a hotel, pub/restaurant, drive-through restaurant or petrol filling station. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs.

These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required.

to meet needs arising from the development. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement.

DLP1755**Comment summary:****Officer response:****Full Name:** T Dodds

Object to the proposals. The site is prone to surface water flooding and the proposals would exacerbate this problem. Increased traffic congestion. Increased pressure on local services and infrastructure, including local schools and health centres. There has been insufficient consultation on the proposals. The site is arable land which could be home to wildlife and birdlife. The area has already been over-developed and the development would ruin the character of this traditional North Yorkshire fishing village.

The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement.

Comment summary:

Object to the proposals. The site is prone to surface water flooding and the proposals would exacerbate this problem. Increased traffic congestion. Increased pressure on local services and infrastructure, including local schools and health centres. There has been insufficient consultation on the proposals. The site is arable land which could be home to wildlife and birdlife. The area has already been over-developed and the development would ruin the character of this traditional North Yorkshire fishing village.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required

to meet needs arising from the development. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The Council expects developers to carry out a genuine and meaningful consultation with local residents, interest groups and recommended/statutory consultees at an early stage, as set out within the Council's adopted Statement of Community Involvement. However, there is no legal obligation for a developer to undertake pre-application consultation and it can only be encouraged by the Council. We have undertaken a 6 week consultation on the draft Local Plan. Throughout the consultation period we held a number of drop-in sessions throughout the Borough, including in Marske, where people could discuss the Plan with Council officers. The consultation and drop-in events were advertised on the Council's website, resident's magazine and notification sent to those on our consultation database. The Council will also hold a 6 week consultation on the Publication draft of the Local Plan. Notification will be sent to those on our consultation database to inform them of the consultation, including anyone who has commented on the draft Local Plan. All of our consultation procedures are set out in the adopted Statement of Community Involvement. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. The policy seeks to deliver a strategic housing site for up to approximately 1,000 dwellings, supporting community facilities, infrastructure and public open space. The Policy does not propose a hotel, pub/restaurant, drive-through restaurant or petrol filling station. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs.

The area has already been over-developed and the development would ruin the character of this traditional North Yorkshire fishing village.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required

to meet needs arising from the development. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement.

The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required

to meet needs arising from the development. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The Council expects developers to carry out a genuine and meaningful consultation with local residents, interest groups and recommended/statutory consultees at an early stage, as set out within the Council's adopted Statement of Community Involvement. However, there is no legal obligation for a developer to undertake pre-application consultation and it can only be encouraged by the Council. We have undertaken a 6 week consultation on the draft Local Plan. Throughout the consultation period we held a number of drop-in sessions throughout the Borough, including in Marske, where people could discuss the Plan with Council officers. The consultation and drop-in events were advertised on the Council's website, resident's magazine and notification sent to those on our consultation database. The Council will also hold a 6 week consultation on the Publication draft of the Local Plan. Notification will be sent to those on our consultation database to inform them of the consultation, including anyone who has commented on the draft Local Plan. All of our consultation procedures are set out in the adopted Statement of Community Involvement. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. The policy seeks to deliver a strategic housing site for up to approximately 1,000 dwellings, supporting community facilities, infrastructure and public open space. The Policy does not propose a hotel, pub/restaurant, drive-through restaurant or petrol filling station. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs.

The Council expects developers to carry out a genuine and meaningful consultation with local residents, interest groups and recommended/statutory consultees at an early stage, as set out within the Council's adopted Statement of Community Involvement. However, there is no legal obligation for a developer to undertake pre-application consultation and it can only be encouraged by the Council. We have undertaken a 6 week consultation on the draft Local Plan. Throughout the consultation period we held a number of drop-in sessions throughout the Borough, including in Marske, where people could discuss the Plan with Council officers. The consultation and drop-in events were advertised on the Council's website, resident's magazine and notification sent to those on our consultation database. The Council will also hold a 6 week consultation on the Publication draft of the Local Plan. Notification will be sent to those on our consultation database to inform them of the consultation, including anyone who has commented on the draft Local Plan. All of our consultation procedures are set out in the adopted Statement of Community Involvement. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. The policy seeks to deliver a strategic housing site for up to approximately 1,000 dwellings, supporting community facilities, infrastructure and public open space. The Policy does not propose a hotel, pub/restaurant, drive-through restaurant or petrol filling station. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs.

Comment summary:

Object to the proposals. The site is prone to surface water flooding and the proposals would exacerbate this problem. Increased traffic congestion. Increased pressure on local services and infrastructure, including local schools and health centres. There has been insufficient consultation on the proposals. The site is arable land which could be home to wildlife and birdlife. The area has already been over-developed and the development would ruin the character of this traditional North Yorkshire fishing village.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required

to meet needs arising from the development. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement.

Increased pressure on local services and infrastructure, including local schools and health centres. There has been insufficient consultation on the proposals. The site is arable land which could be home to wildlife and birdlife. The area has already been over-developed and the development would ruin the character of this traditional North Yorkshire fishing village.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required

to meet needs arising from the development. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement.

Comment summary:

Object to the proposals. The site is prone to surface water flooding and the proposals would exacerbate this problem. Increased traffic congestion. Increased pressure on local services and infrastructure, including local schools and health centres. There has been insufficient consultation on the proposals. The site is arable land which could be home to wildlife and birdlife. The area has already been over-developed and the development would ruin the character of this traditional North Yorkshire fishing village.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required

to meet needs arising from the development. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required

to meet needs arising from the development. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The Council expects developers to carry out a genuine and meaningful consultation with local residents, interest groups and recommended/statutory consultees at an early stage, as set out within the Council's adopted Statement of Community Involvement. However, there is no legal obligation for a developer to undertake pre-application consultation and it can only be encouraged by the Council. We have undertaken a 6 week consultation on the draft Local Plan. Throughout the consultation period we held a number of drop-in sessions throughout the Borough, including in Marske, where people could discuss the Plan with Council officers. The consultation and drop-in events were advertised on the Council's website, resident's magazine and notification sent to those on our consultation database. The Council will also hold a 6 week consultation on the Publication draft of the Local Plan. Notification will be sent to those on our consultation database to inform them of the consultation, including anyone who has commented on the draft Local Plan. All of our consultation procedures are set out in the adopted Statement of Community Involvement. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. The policy seeks to deliver a strategic housing site for up to approximately 1,000 dwellings, supporting community facilities, infrastructure and public open space. The Policy does not propose a hotel, pub/restaurant, drive-through restaurant or petrol filling station. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs.

As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required

to meet needs arising from the development. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement.

Comment summary:

Object to the proposals. The site is prone to surface water flooding and the proposals would exacerbate this problem. Increased traffic congestion. Increased pressure on local services and infrastructure, including local schools and health centres. There has been insufficient consultation on the proposals. The site is arable land which could be home to wildlife and birdlife. The area has already been over-developed and the development would ruin the character of this traditional North Yorkshire fishing village.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. Comment summary:

Object to the proposals. The site is prone to surface water flooding and the proposals would exacerbate this problem. Increased traffic congestion. Increased pressure on local services and infrastructure, including local schools and health centres. There has been insufficient consultation on the proposals. The site is arable land which could be home to wildlife and birdlife. The area has already been over-developed and the development would ruin the character of this traditional North Yorkshire fishing village.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required

to meet needs arising from the development. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement.

The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The Council expects developers to carry out a genuine and meaningful consultation with local residents, interest groups and recommended/statutory consultees at an early stage, as set out within the Council's adopted Statement of Community Involvement. However, there is no legal obligation for a developer to undertake pre-application consultation and it can only be encouraged by the Council. We have undertaken a 6 week consultation on the draft Local Plan. Throughout the consultation period we held a number of drop-in sessions throughout the Borough, including in Marske, where people could discuss the Plan with Council officers. The consultation and drop-in events were advertised on the Council's website, resident's magazine and notification sent to those on our consultation database. The Council will also hold a 6 week consultation on the Publication draft of the Local Plan. Notification will be sent to those on our consultation database to inform them of the consultation, including anyone who has commented on the draft Local Plan. All of our consultation procedures are set out in the adopted Statement of Community Involvement. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. The policy seeks to deliver a strategic housing site for up to approximately 1,000 dwellings, supporting community facilities, infrastructure and public open space. The Policy does not propose a hotel, pub/restaurant, drive-through restaurant or petrol filling station. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs.

Comment summary:

Object to the proposals. The site is prone to surface water flooding and the proposals would exacerbate this problem. Increased traffic congestion. Increased pressure on local services and infrastructure, including local schools and health centres. There has been insufficient consultation on the proposals. The site is arable land which could be home to wildlife and birdlife. The area has already been over-developed and the development would ruin the character of this traditional North Yorkshire fishing village.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required

to meet needs arising from the development. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The Council expects developers to carry out a genuine and meaningful consultation with local residents, interest groups and recommended/statutory consultees at an early stage, as set out within the Council's adopted Statement of Community Involvement. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement.

Comment summary:

Object to the proposals. The site is prone to surface water flooding and the proposals would exacerbate this problem. Increased traffic congestion. Increased pressure on local services and infrastructure, including local schools and health centres. There has been insufficient consultation on the proposals. The site is arable land which could be home to wildlife and birdlife. The area has already been over-developed and the development would ruin the character of this traditional North Yorkshire fishing village.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required

to meet needs arising from the development. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The Council expects developers to carry out a genuine and meaningful consultation with local residents, interest groups and recommended/statutory consultees at an early stage, as set out within the Council's adopted Statement of Community Involvement. However, there is no legal obligation for a developer to undertake pre-application consultation and it can only be encouraged by the Council. We have undertaken a 6 week consultation on the draft Local Plan. Throughout the consultation period we held a number of drop-in sessions throughout the Borough, including in Marske, where people could discuss the Plan with Council officers. The consultation and drop-in events were advertised on the Council's website, resident's magazine and notification sent to those on our consultation database. The Council will also hold a 6 week consultation on the Publication draft of the Local Plan. Notification will be sent to those on our consultation database to inform them of the consultation, including anyone who has commented on the draft Local Plan. All of our consultation procedures are set out in the adopted Statement of Community Involvement. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. The policy seeks to deliver a strategic housing site for up to approximately 1,000 dwellings, supporting community facilities, infrastructure and public open space. The Policy does not propose a hotel, pub/restaurant, drive-through restaurant or petrol filling station. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs.

A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required

to meet needs arising from the development. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement.

Marske Inn Farm Strategic Site

Submission type: Letter

Agree with section?: No

Comment summary:

Object to the proposals. The site is prone to surface water flooding and the proposals would exacerbate this problem. Increased traffic congestion. Increased pressure on local services and infrastructure, including local schools and health centres. There has been insufficient consultation on the proposals. The site is arable land which could be home to wildlife and birdlife. The area has already been over-developed and the development would ruin the character of this traditional North Yorkshire fishing village.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required

to meet needs arising from the development. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement.

The site is arable land which could be home to wildlife and birdlife. The area has already been over-developed and the development would ruin the character of this traditional North Yorkshire fishing village.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required

to meet needs arising from the development. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The Council expects developers to carry out a genuine and meaningful consultation with local residents, interest groups and recommended/statutory consultees at an early stage, as set out within the Council's adopted Statement of Community Involvement. However, there is no legal obligation for a developer to undertake pre-application consultation and it can only be encouraged by the Council. We have undertaken a 6 week consultation on the draft Local Plan. Throughout the consultation period we held a number of drop-in sessions throughout the Borough, including in Marske, where people could discuss the Plan with Council officers. The consultation and drop-in events were advertised on the Council's website, resident's magazine and notification sent to those on our consultation database. The Council will also hold a 6 week consultation on the Publication draft of the Local Plan. Notification will be sent to those on our consultation database to inform them of the consultation, including anyone who has commented on the draft Local Plan. All of our consultation procedures are set out in the adopted Statement of Community Involvement. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. The policy seeks to deliver a strategic housing site for up to approximately 1,000 dwellings, supporting community facilities, infrastructure and public open space. The Policy does not propose a hotel, pub/restaurant, drive-through restaurant or petrol filling station. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs.

Comment summary:

Consider the Draft Plan as written ineffective as it appears to offer safeguards against housing development, such as that proposed at Marske, yet these do not prevent the application being considered. No demand for housing in Marske, as there are lots of properties for sale. Proposals would impact upon local distinctiveness. Traffic and congestion would be increased. Proposed development is in an area of flood risk and does not support the reclaiming and reusing of derelict land. The proposed development would not allow people to live closer to their place of work, shops and services, therefore the development would add to congestion. Plan does not prioritise development on previously developed land. Proposals would harm Marske district centre. Proposal will create very limited employment opportunities for new residents. Plan will not safeguard biodiversity and geodiversity or open areas in and around the town. It will remove a large tract of arable land close to a nearby wooded area. Proposal will not protect and enhance Strategic gaps between Marske and New Marske; Marske and Saltburn, and the green wedges in the conurbation. Population is declining and is a high unemployment rate. No plan to create jobs in advance of the housing. Local services would be put at risk. High density housing is not appropriate in Marske.

Officer response:

A landowner is able to make a planning application for development on their land at any point in time and it is the Council's legal duty to assess the merits of that planning application in accordance with the development plan. The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood

Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The proposals would likely increase the usage of Marske district centre, having a positive impact upon its vitality and viability. The Local Plan seeks to support economic growth and job creation. The plan also seeks to support the key industrial sectors of the port, chemicals, steel, and recycling industries whilst recognising the need to diversify the economy so that it is more resilient to change in the future. The plan also puts policies in place to support small and medium sized business as well as the tourism industry which has the potential for significant growth building upon the natural assets of the borough. House building is also a key economic sector, with housing development and economic growth intrinsically linked. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. Whilst it is recognised that the proposals would result in a narrowing of the strategic gap between Marske and New Marske, the policy indicates that a deep planting buffer will be provided towards the A174, which will help to reinforce the strategic gap and retain its integrity. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required to meet needs arising from the development. The policy indicates that the housing element of the site should achieve an indicative overall density of 30 dwellings per hectare. This is not considered to be high density and would be consistent with existing housing densities within Marske.

Comment summary:

No need for this amount of new housing, as there are lots of houses for sale in the area. New development is often designed poorly and does not reflect local character and distinctiveness. Increased congestion. The area is prone to flooding as shown on by the British Geological Survey Groundwater Flood Susceptibility map for the area. Development should be on brownfield sites and not greenfield. The site is not located close to the main employment areas, thus reducing the distances people need to travel. The plan will not safeguard and enhance Marske district centre. The plan would damage the distinctive character of Marske. Housing plan will not help diversify the economy. Housebuilding jobs would be temporary and jobs in proposed hotel, pub/restaurant, drive-through and petrol filling station would be minimal and low paid. The plan would harm biodiversity and geodiversity interests. The proposals would damage the strategic gap between Marske and New Marske. No plan to create new jobs, healthcare or education provision, so existing services will be put at risk. Marske should not be included within the conurbation area. High density housing is not appropriate in Marske. Proposed single carriageway under Marske railway bridge would make congestion worse.

Officer response:

The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across

the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The Council has prioritised development on the most sustainable sites to meet identified housing needs, whilst ensuring that sites are viable for residential development and have a realistic prospect of being delivered within the plan period. The Local Plan seeks to support economic growth and job creation alongside providing an adequate supply of housing to meet identified needs. House building is a key economic sector, with housing development and economic growth intrinsically linked. The proposals are likely to increase the usage of Marske district centre and enhance its vitality and viability as a result. The policy seeks to deliver a strategic housing site for up to approximately 1,000 dwellings, supporting community facilities, infrastructure and public open space. The Policy does not propose a hotel, pub/restaurant, drive-through restaurant or petrol filling station. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required

to meet needs arising from the development. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The Council expects developers to carry out a genuine and meaningful consultation with local residents, interest groups and recommended/statutory consultees at an early stage, as set out within the Council's adopted Statement of Community Involvement. However, there is no legal obligation for a developer to undertake pre-application consultation and it can only be encouraged by the Council. We have undertaken a 6 week consultation on the draft Local Plan. Throughout the consultation period we held a number of drop-in sessions throughout the Borough, including in Marske, where people could discuss the Plan with Council officers. The consultation and drop-in events were advertised on the Council's website, resident's magazine and notification sent to those on our consultation database. The Council will also hold a 6 week consultation on the Publication draft of the Local Plan. Notification will be sent to those on our consultation database to inform them of the consultation, including anyone who has commented on the draft Local Plan. All of our consultation procedures are set out in the adopted Statement of Community Involvement. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. The policy seeks to deliver a strategic housing site for up to approximately 1,000 dwellings, supporting community facilities, infrastructure and public open space. The Policy does not propose a hotel, pub/restaurant, drive-through restaurant or petrol filling station. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs.

Comment summary:

No need for this amount of new housing, as there are lots of houses for sale in the area. New development is often designed poorly and does not reflect local character and distinctiveness. Increased congestion. The area is prone to flooding as shown on by the British Geological Survey Groundwater Flood Susceptibility map for the area. Development should be on brownfield sites and not greenfield. The site is not located close to the main employment areas, thus reducing the distances people need to travel. The plan will not safeguard and enhance Marske district centre. The plan would damage the distinctive character of Marske. Housing plan will not help diversify the economy. Housebuilding jobs would be temporary and jobs in proposed hotel, pub/restaurant, drive-through and petrol filling station would be minimal and low paid. The plan would harm biodiversity and geodiversity interests. The proposals would damage the strategic gap between Marske and New Marske. No plan to create new jobs, healthcare or education provision, so existing services will be put at risk. Marske should not be included within the conurbation area. High density housing is not appropriate in Marske. Proposed single carriageway under Marske railway bridge would make congestion worse.

Officer response:

The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across

the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The Council has prioritised development on the most sustainable sites to meet identified housing needs, whilst ensuring that sites are viable for residential development and have a realistic prospect of being delivered within the plan period. The Local Plan seeks to support economic growth and job creation alongside providing an adequate supply of housing to meet identified needs. House building is a key economic sector, with housing development and economic growth intrinsically linked. The proposals are likely to increase the usage of Marske district centre and enhance its vitality and viability as a result. The policy seeks to deliver a strategic housing site for up to approximately 1,000 dwellings, supporting community facilities, infrastructure and public open space. The Policy does not propose a hotel, pub/restaurant, drive-through restaurant or petrol filling station. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. Whilst it is recognised that the proposals would result in a narrowing of the strategic gap between Marske and New Marske, the policy indicates that a deep planting buffer will be provided towards the A174, which will help to reinforce the strategic gap and retain its integrity. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required to meet needs arising from the development. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development.

Comment summary:

Object to the proposals. The site is prone to surface water flooding and the proposals would exacerbate this problem. Increased traffic congestion. Increased pressure on local services and infrastructure, including local schools and health centres. There has been insufficient consultation on the proposals. The site is arable land which could be home to wildlife and birdlife. The area has already been over-developed and the development would ruin the character of this traditional North Yorkshire fishing village.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required

to meet needs arising from the development. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The Council expects developers to carry out a genuine and meaningful consultation with local residents, interest groups and recommended/statutory consultees at an early stage, as set out within the Council's adopted Statement of Community Involvement. However, there is no legal obligation for a developer to undertake pre-application consultation and it can only be encouraged by the Council. We have undertaken a 6 week consultation on the draft Local Plan. Throughout the consultation period we held a number of drop-in sessions throughout the Borough, including in Marske, where people could discuss the Plan with Council officers. The consultation and drop-in events were advertised on the Council's website, resident's magazine and notification sent to those on our consultation database. The Council will also hold a 6 week consultation on the Publication draft of the Local Plan. Notification will be sent to those on our consultation database to inform them of the consultation, including anyone who has commented on the draft Local Plan. All of our consultation procedures are set out in the adopted Statement of Community Involvement. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. The policy seeks to deliver a strategic housing site for up to approximately 1,000 dwellings, supporting community facilities, infrastructure and public open space. The Policy does not propose a hotel, pub/restaurant, drive-through restaurant or petrol filling station. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs.

Comment summary:

Object to the proposals. The site is prone to surface water flooding and the proposals would exacerbate this problem. Increased traffic congestion. Increased pressure on local services and infrastructure, including local schools and health centres. There has been insufficient consultation on the proposals. The site is arable land which could be home to wildlife and birdlife. The area has already been over-developed and the development would ruin the character of this traditional North Yorkshire fishing village.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. Object to the proposals. The site is prone to surface water flooding and the proposals would exacerbate this problem. Increased traffic congestion. Increased pressure on local services and infrastructure, including local schools and health centres. There has been insufficient consultation on the proposals. The site is arable land which could be home to wildlife and birdlife. The area has already been over-developed and the development would ruin the character of this traditional North Yorkshire fishing village.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required

to meet needs arising from the development. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The Council expects developers to carry out a genuine and meaningful consultation with local residents, interest groups and recommended/statutory consultees at an early stage, as set out within the Council's adopted Statement of Community Involvement. However, there is no legal obligation for a developer to undertake pre-application consultation and it can only be encouraged by the Council. We have undertaken a 6 week consultation on the draft Local Plan. Throughout the consultation period we held a number of drop-in sessions throughout the Borough, including in Marske, where people could discuss the Plan with Council officers. The consultation and drop-in events were advertised on the Council's website, resident's magazine and notification sent to those on our consultation database. The Council will also hold a 6 week consultation on the Publication draft of the Local Plan. Notification will be sent to those on our consultation database to inform them of the consultation, including anyone who has commented on the draft Local Plan. All of our consultation procedures are set out in the adopted Statement of Community Involvement. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. The policy seeks to deliver a strategic housing site for up to approximately 1,000 dwellings, supporting community facilities, infrastructure and public open space. The Policy does not propose a hotel, pub/restaurant, drive-through restaurant or petrol filling station. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs.

The Policy does not propose a hotel, pub/restaurant, drive-through restaurant or petrol filling station. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs.

Comment summary:

Object to the proposals. The site is prone to surface water flooding and the proposals would exacerbate this problem. Increased traffic congestion. Increased pressure on local services and infrastructure, including local schools and health centres. There has been insufficient consultation on the proposals. The site is arable land which could be home to wildlife and birdlife. The area has already been over-developed and the development would ruin the character of this traditional North Yorkshire fishing village. Brownfield sites should be prioritised over greenfield sites in accordance with the NPPF and the Council's own draft plan.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required

to meet needs arising from the development. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The Council expects developers to carry out a genuine and meaningful consultation with local residents, interest groups and recommended/statutory consultees at an early stage, as set out within the Council's adopted Statement of Community Involvement. However, there is no legal obligation for a developer to undertake pre-application consultation and it can only be encouraged by the Council. We have undertaken a 6 week consultation on the draft Local Plan. Throughout the consultation period we held a number of drop-in sessions throughout the Borough, including in Marske, where people could discuss the Plan with Council officers. The consultation and drop-in events were advertised on the Council's website, resident's magazine and notification sent to those on our consultation database. The Council will also hold a 6 week consultation on the Publication draft of the Local Plan. Notification will be sent to those on our consultation database to inform them of the consultation, including anyone who has commented on the draft Local Plan. All of our consultation procedures are set out in the adopted Statement of Community Involvement. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. The policy seeks to deliver a strategic housing site for up to approximately 1,000 dwellings, supporting community facilities, infrastructure and public open space. The Policy does not propose a hotel, pub/restaurant, drive-through restaurant or petrol filling station. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. We have undertaken a 6 week consultation on the draft Local Plan. Throughout the consultation period we held a number of drop-in sessions throughout the Borough, including in Marske, where people could discuss the Plan with Council officers. The consultation and drop-in events were advertised on the Council's website, resident's magazine and notification sent to those on our consultation database. The Council will also hold a 6 week consultation on the Publication draft of the Local Plan. Notification will be sent to those on our consultation database to inform them of the consultation, including anyone who has commented on the draft Local Plan. All of our consultation procedures are set out in the adopted Statement of Community Involvement. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. The policy seeks to deliver a strategic housing site for up to approximately 1,000 dwellings, supporting community facilities, infrastructure and public open space. The Policy does not propose a hotel, pub/restaurant, drive-through restaurant or petrol filling station. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs.

Comment summary:

Object to the proposals. The site is prone to surface water flooding and the proposals would exacerbate this problem. Increased traffic congestion. Increased pressure on local services and infrastructure, including local schools and health centres. There has been insufficient consultation on the proposals. The site is arable land which could be home to wildlife and birdlife. The area has already been over-developed and the development would ruin the character of this traditional North Yorkshire fishing village.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required

to meet needs arising from the development. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The Council expects developers to carry out a genuine and meaningful consultation with local residents, interest groups and recommended/statutory consultees at an early stage, as set out within the Council's adopted Statement of Community Involvement. However, there is no legal obligation for a developer to undertake pre-application consultation and it can only be encouraged by the Council. We have undertaken a 6 week consultation on the draft Local Plan. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required

to meet needs arising from the development. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The Council expects developers to carry out a genuine and meaningful consultation with local residents, interest groups and recommended/statutory consultees at an early stage, as set out within the Council's adopted Statement of Community Involvement. However, there is no legal obligation for a developer to undertake pre-application consultation and it can only be encouraged by the Council. We have undertaken a 6 week consultation on the draft Local Plan. Throughout the consultation period we held a number of drop-in sessions throughout the Borough, including in Marske, where people could discuss the Plan with Council officers. The consultation and drop-in events were advertised on the Council's website, resident's magazine and notification sent to those on our consultation database. The Council will also hold a 6 week consultation on the Publication draft of the Local Plan. Notification will be sent to those on our consultation database to inform them of the consultation, including anyone who has commented on the draft Local Plan. All of our consultation procedures are set out in the adopted Statement of Community Involvement. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. The policy seeks to deliver a strategic housing site for up to approximately 1,000 dwellings, supporting community facilities, infrastructure and public open space. The Policy does not propose a hotel, pub/restaurant, drive-through restaurant or petrol filling station. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs.

Comment summary:

Object to the proposals. The site is prone to surface water flooding and the proposals would exacerbate this problem. Increased traffic congestion. Increased pressure on local services and infrastructure, including local schools and health centres. There has been insufficient consultation on the proposals. The site is arable land which could be home to wildlife and birdlife. The area has already been over-developed and the development would ruin the character of this traditional North Yorkshire fishing village. Brownfield sites should be prioritised over greenfield sites in accordance with the NPPF and the Council's own draft plan.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required

to meet needs arising from the development. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required

to meet needs arising from the development. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The Council expects developers to carry out a genuine and meaningful consultation with local residents, interest groups and recommended/statutory consultees at an early stage, as set out within the Council's adopted Statement of Community Involvement. However, there is no legal obligation for a developer to undertake pre-application consultation and it can only be encouraged by the Council. We have undertaken a 6 week consultation on the draft Local Plan. Throughout the consultation period we held a number of drop-in sessions throughout the Borough, including in Marske, where people could discuss the Plan with Council officers. The consultation and drop-in events were advertised on the Council's website, resident's magazine and notification sent to those on our consultation database. The Council will also hold a 6 week consultation on the Publication draft of the Local Plan. Notification will be sent to those on our consultation database to inform them of the consultation, including anyone who has commented on the draft Local Plan. All of our consultation procedures are set out in the adopted Statement of Community Involvement. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. The policy seeks to deliver a strategic housing site for up to approximately 1,000 dwellings, supporting community facilities, infrastructure and public open space. The Policy does not propose a hotel, pub/restaurant, drive-through restaurant or petrol filling station. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs.

Comment summary:

Object to the proposals. The site is prone to surface water flooding and the proposals would exacerbate this problem. Increased traffic congestion. Increased pressure on local services and infrastructure, including local schools and health centres. There has been insufficient consultation on the proposals. The site is arable land which could be home to wildlife and birdlife. The area has already been over-developed and the development would ruin the character of this traditional North Yorkshire fishing village.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required

to meet needs arising from the development. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The Council expects developers to carry out a genuine and meaningful consultation with local residents, interest groups and recommended/statutory consultees at an early stage, as set out within the Council's adopted Statement of Community Involvement. However, there is no legal obligation for a developer to undertake pre-application consultation and it can only be encouraged by the Council. We have undertaken a 6 week consultation on the draft Local Plan. Throughout the consultation period we held a number of drop-in sessions throughout the Borough, including in Marske, where people could discuss the Plan with Council officers. The consultation and drop-in events were advertised on the Council's website, resident's magazine and notification sent to those on our consultation database. The Council will also hold a 6 week consultation on the Publication draft of the Local Plan. Notification will be sent to those on our consultation database to inform them of the consultation, including anyone who has commented on the draft Local Plan. All of our consultation procedures are set out in the adopted Statement of Community Involvement. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. The policy seeks to deliver a strategic housing site for up to approximately 1,000 dwellings, supporting community facilities, infrastructure and public open space. The Policy does not propose a hotel, pub/restaurant, drive-through restaurant or petrol filling station. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs.

Comment summary:

Object to the proposals. The site is prone to surface water flooding and the proposals would exacerbate this problem. Increased traffic congestion. Increased pressure on local services and infrastructure, including local schools and health centres. There has been insufficient consultation on the proposals. The site is arable land which could be home to wildlife and birdlife. The area has already been over-developed and the development would ruin the character of this traditional North Yorkshire fishing village.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. Comment summary:

Object to the proposals. The site is prone to surface water flooding and the proposals would exacerbate this problem. Increased traffic congestion. Increased pressure on local services and infrastructure, including local schools and health centres. There has been insufficient consultation on the proposals. The site is arable land which could be home to wildlife and birdlife. The area has already been over-developed and the development would ruin the character of this traditional North Yorkshire fishing village.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required

to meet needs arising from the development. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The Council expects developers to carry out a genuine and meaningful consultation with local residents, interest groups and recommended/statutory consultees at an early stage, as set out within the Council's adopted Statement of Community Involvement. However, there is no legal obligation for a developer to undertake pre-application consultation and it can only be encouraged by the Council. We have undertaken a 6 week consultation on the draft Local Plan. Throughout the consultation period we held a number of drop-in sessions throughout the Borough, including in Marske, where people could discuss the Plan with Council officers. The consultation and drop-in events were advertised on the Council's website, resident's magazine and notification sent to those on our consultation database. The Council will also hold a 6 week consultation on the Publication draft of the Local Plan. Notification will be sent to those on our consultation database to inform them of the consultation, including anyone who has commented on the draft Local Plan. All of our consultation procedures are set out in the adopted Statement of Community Involvement. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. The policy seeks to deliver a strategic housing site for up to approximately 1,000 dwellings, supporting community facilities, infrastructure and public open space. The Policy does not propose a hotel, pub/restaurant, drive-through restaurant or petrol filling station. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs.

The policy seeks to deliver a strategic housing site for up to approximately 1,000 dwellings, supporting community facilities, infrastructure and public open space. The Policy does not propose a hotel, pub/restaurant, drive-through restaurant or petrol filling station. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs.

Comment summary:

Object to the proposals. The site is prone to surface water flooding and the proposals would exacerbate this problem. Increased traffic congestion. Increased pressure on local services and infrastructure, including local schools and health centres. There has been insufficient consultation on the proposals. The site is arable land which could be home to wildlife and birdlife. The area has already been over-developed and the development would ruin the character of this traditional North Yorkshire fishing village.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required

to meet needs arising from the development. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The Council expects developers to carry out a genuine and meaningful consultation with local residents, interest groups and recommended/statutory consultees at an early stage, as set out within the Council's adopted Statement of Community Involvement. However, there is no legal obligation for a developer to undertake pre-application consultation and it can only be encouraged by the Council. We have undertaken a 6 week consultation on the draft Local Plan. Throughout the consultation period we held a number of drop-in sessions throughout the Borough, including in Marske, where people could discuss the Plan with Council officers. The consultation and drop-in events were advertised on the Council's website, resident's magazine and notification sent to those on our consultation database. The Council will also hold a 6 week consultation on the Publication draft of the Local Plan. Notification will be sent to those on our consultation database to inform them of the consultation, including anyone who has commented on the draft Local Plan. All of our consultation procedures are set out in the adopted Statement of Community Involvement. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. The policy seeks to deliver a strategic housing site for up to approximately 1,000 dwellings, supporting community facilities, infrastructure and public open space. The Policy does not propose a hotel, pub/restaurant, drive-through restaurant or petrol filling station. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. We have undertaken a 6 week consultation on the draft Local Plan. Throughout the consultation period we held a number of drop-in sessions throughout the Borough, including in Marske, where people could discuss the Plan with Council officers. The consultation and drop-in events were advertised on the Council's website, resident's magazine and notification sent to those on our consultation database. The Council will also hold a 6 week consultation on the Publication draft of the Local Plan. Notification will be sent to those on our consultation database to inform them of the consultation, including anyone who has commented on the draft Local Plan. All of our consultation procedures are set out in the adopted Statement of Community Involvement. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. The policy seeks to deliver a strategic housing site for up to approximately 1,000 dwellings, supporting community facilities, infrastructure and public open space. The Policy does not propose a hotel, pub/restaurant, drive-through restaurant or petrol filling station. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs.

Comment summary:

Object to the proposals. The site is prone to surface water flooding and the proposals would exacerbate this problem. Increased traffic congestion. Increased pressure on local services and infrastructure, including local schools and health centres. There has been insufficient consultation on the proposals. The site is arable land which could be home to wildlife and birdlife. The area has already been over-developed and the development would ruin the character of this traditional North Yorkshire fishing village.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required

to meet needs arising from the development. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The Council expects developers to carry out a genuine and meaningful consultation with local residents, interest groups and recommended/statutory consultees at an early stage, as set out within the Council's adopted Statement of Community Involvement. However, there is no legal obligation for a developer to undertake pre-application consultation and it can only be encouraged by the Council. We have undertaken a 6 week consultation on the draft Local Plan. Throughout the consultation period we held a number of drop-in sessions throughout the Borough, including in Marske, where people could discuss the Plan with Council officers. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required

to meet needs arising from the development. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The Council expects developers to carry out a genuine and meaningful consultation with local residents, interest groups and recommended/statutory consultees at an early stage, as set out within the Council's adopted Statement of Community Involvement. However, there is no legal obligation for a developer to undertake pre-application consultation and it can only be encouraged by the Council. We have undertaken a 6 week consultation on the draft Local Plan. Throughout the consultation period we held a number of drop-in sessions throughout the Borough, including in Marske, where people could discuss the Plan with Council officers. The consultation and drop-in events were advertised on the Council's website, resident's magazine and notification sent to those on our consultation database. The Council will also hold a 6 week consultation on the Publication draft of the Local Plan. Notification will be sent to those on our consultation database to inform them of the consultation, including anyone who has commented on the draft Local Plan. All of our consultation procedures are set out in the adopted Statement of Community Involvement. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. The policy seeks to deliver a strategic housing site for up to approximately 1,000 dwellings, supporting community facilities, infrastructure and public open space. The Policy does not propose a hotel, pub/restaurant, drive-through restaurant or petrol filling station. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs.

Comment summary:

Object to the proposals. The site is prone to surface water flooding and the proposals would exacerbate this problem. Increased traffic congestion. Increased pressure on local services and infrastructure, including local schools and health centres. There has been insufficient consultation on the proposals. The site is arable land which could be home to wildlife and birdlife. The area has already been over-developed and the development would ruin the character of this traditional North Yorkshire fishing village.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required

Object to housing on greenfield sites in Redcar and Marske because we do not need anymore houses. There will be too much traffic on already very busy roads.

Officer response:

The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required

to meet needs arising from the development. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The Council expects developers to carry out a genuine and meaningful consultation with local residents, interest groups and recommended/statutory consultees at an early stage, as set out within the Council's adopted Statement of Community Involvement. However, there is no legal obligation for a developer to undertake pre-application consultation and it can only be encouraged by the Council. We have undertaken a 6 week consultation on the draft Local Plan. Throughout the consultation period we held a number of drop-in sessions throughout the Borough, including in Marske, where people could discuss the Plan with Council officers. The consultation and drop-in events were advertised on the Council's website, resident's magazine and notification sent to those on our consultation database. The Council will also hold a 6 week consultation on the Publication draft of the Local Plan. Notification will be sent to those on our consultation database to inform them of the consultation, including anyone who has commented on the draft Local Plan. All of our consultation procedures are set out in the adopted Statement of Community Involvement. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. The policy seeks to deliver a strategic housing site for up to approximately 1,000 dwellings, supporting community facilities, infrastructure and public open space. The Policy does not propose a hotel, pub/restaurant, drive-through restaurant or petrol filling station. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs.

Comment summary:

Object to the proposals. The site is prone to surface water flooding and the proposals would exacerbate this problem. Increased traffic congestion. Increased pressure on local services and infrastructure, including local schools and health centres. There has been insufficient consultation on the proposals. The site is arable land which could be home to wildlife and birdlife. The area has already been over-developed and the development would ruin the character of this traditional North Yorkshire fishing village.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. However, there is no legal obligation for a developer to undertake pre-application consultation and it can only be encouraged by the Council. We have undertaken a 6 week consultation on the draft Local Plan. Throughout the consultation period we held a number of drop-in sessions throughout the Borough, including in Marske, where people could discuss the Plan with Council officers. The consultation and drop-in events were advertised on the Council's website, resident's magazine and notification sent to those on our consultation database. The Council will also hold a 6 week consultation on the Publication draft of the Local Plan. Notification will be sent to those on our consultation database to inform them of the consultation, including anyone who has commented on the draft Local Plan. All of our consultation procedures are set out in the adopted Statement of Community Involvement. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. The policy seeks to deliver a strategic housing site for up to approximately 1,000 dwellings, supporting community facilities, infrastructure and public open space. The Policy does not propose a hotel, pub/restaurant, drive-through restaurant or petrol filling station. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs.

Comment summary:

Consider the Draft Plan as written ineffective as it appears to offer safeguards against housing development, such as that proposed at Marske, yet these do not prevent the application being considered. No demand for housing in Marske, as there are lots of properties for sale. Proposals would impact upon local distinctiveness. Traffic and congestion would be increased. Proposed development is in an area of flood risk and does not support the reclaiming and reusing of derelict land. The proposed development would not allow people to live closer to their place of work, shops and services, therefore the development would add to congestion. Plan does not prioritise development on previously developed land. Proposals would harm Marske district centre. Proposal will create very limited employment opportunities for new residents. Plan will not safeguard biodiversity and geodiversity or open areas in and around the town. It will remove a large tract of arable land close to a nearby wooded area. Proposal will not protect and enhance Strategic gaps between Marske and New Marske; Marske and Saltburn, and the green wedges in the conurbation. Population is declining and is a high unemployment rate. No plan to create jobs in advance of the housing. Local services would be put at risk. High density housing is not appropriate in Marske.

Officer response:

A landowner is able to make a planning application for development on their land at any point in time and it is the Council's legal duty to assess the merits of that planning application in accordance with the development plan. The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood

Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The proposals would likely increase the usage of Marske district centre, having a positive impact upon its vitality and viability. The Local Plan seeks to support economic growth and job creation. The plan also seeks to support the key industrial sectors of the port, chemicals, steel, and recycling industries whilst recognising the need to diversify the economy so that it is more resilient to change in the future. The plan also puts policies in place to support small and medium sized business as well as the tourism industry which has the potential for significant growth building upon the natural assets of the borough. House building is also a key economic sector, with housing development and economic growth intrinsically linked. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. Whilst it is recognised that the proposals would result in a narrowing of the strategic gap between Marske and New Marske, the policy indicates that a deep planting buffer will be provided towards the A174, which will help to reinforce the strategic gap and retain its integrity. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required to meet needs arising from the development. The policy indicates that the housing element of the site should achieve an indicative overall density of 30 dwellings per hectare. This is not considered to be high density and would be consistent with existing housing densities within Marske.

A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required

to meet needs arising from the development. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The Council expects developers to carry out a genuine and meaningful consultation with local residents, interest groups and recommended/statutory consultees at an early stage, as set out within the Council's adopted Statement of Community Involvement. However, there is no legal obligation for a developer to undertake pre-application consultation and it can only be encouraged by the Council. We have undertaken a 6 week consultation on the draft Local Plan. Throughout the consultation period we held a number of drop-in sessions throughout the Borough, including in Marske, where people could discuss the Plan with Council officers. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required

to meet needs arising from the development. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The Council expects developers to carry out a genuine and meaningful consultation with local residents, interest groups and recommended/statutory consultees at an early stage, as set out within the Council's adopted Statement of Community Involvement. However, there is no legal obligation for a developer to undertake pre-application consultation and it can only be encouraged by the Council. We have undertaken a 6 week consultation on the draft Local Plan. Throughout the consultation period we held a number of drop-in sessions throughout the Borough, including in Marske, where people could discuss the Plan with Council officers. The consultation and drop-in events were advertised on the Council's website, resident's magazine and notification sent to those on our consultation database. The Council will also hold a 6 week consultation on the Publication draft of the Local Plan. Notification will be sent to those on our consultation database to inform them of the consultation, including anyone who has commented on the draft Local Plan. All of our consultation procedures are set out in the adopted Statement of Community Involvement. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. The policy seeks to deliver a strategic housing site for up to approximately 1,000 dwellings, supporting community facilities, infrastructure and public open space. The Policy does not propose a hotel, pub/restaurant, drive-through restaurant or petrol filling station. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs.

Comment summary:

Object to the proposals. The site is prone to surface water flooding and the proposals would exacerbate this problem. Increased traffic congestion. Increased pressure on local services and infrastructure, including local schools and health centres. There has been insufficient consultation on the proposals. The site is arable land which could be home to wildlife and birdlife. The area has already been over-developed and the development would ruin the character of this traditional North Yorkshire fishing village.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. Comment summary:

No need for this amount of new housing, as there are lots of houses for sale in the area. New development is often designed poorly and does not reflect local character and distinctiveness. Increased congestion. The area is prone to flooding as shown on by the British Geological Survey Groundwater Flood Susceptibility map for the area. Development should be on brownfield sites and not greenfield. The site is not located close to the main employment areas, thus reducing the distances people need to travel. The plan will not safeguard and enhance Marske district centre. The plan would damage the distinctive character of Marske. Housing plan will not help diversify the economy. Housebuilding jobs would be temporary and jobs in proposed hotel, pub/restaurant, drive-through and petrol filling station would be minimal and low paid. The plan would harm biodiversity and geodiversity interests. The proposals would damage the strategic gap between Marske and New Marske. No plan to create new jobs, healthcare or education provision, so existing services will be put at risk. Marske should not be included within the conurbation area. High density housing is not appropriate in Marske. Proposed single carriageway under Marske railway bridge would make congestion worse.

Officer response:

The Council has allocated sufficient sites to meet its objectively assessed housing needs. The housing requirement has been established using a robust evidence base taking account of the Government's latest household projection figures, economic growth forecasts and the Council's desire to achieve population stabilisation, set within the context of an increasing number of households throughout the UK due to more people choosing to live alone, family break-ups and increased life expectancy. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across

the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs. The Council has prioritised development on the most sustainable sites to meet identified housing needs, whilst ensuring that sites are viable for residential development and have a realistic prospect of being delivered within the plan period. The Local Plan seeks to support economic growth and job creation alongside providing an adequate supply of housing to meet identified needs. House building is a key economic sector, with housing development and economic growth intrinsically linked. The proposals are likely to increase the usage of Marske district centre and enhance its vitality and viability as a result. The policy seeks to deliver a strategic housing site for up to approximately 1,000 dwellings, supporting community facilities, infrastructure and public open space. The Policy does not propose a hotel, pub/restaurant, drive-through restaurant or petrol filling station. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. Whilst it is recognised that the proposals would result in a narrowing of the strategic gap between Marske and New Marske, the policy indicates that a deep planting buffer will be provided towards the A174, which will help to reinforce the strategic gap and retain its integrity. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required to meet needs arising from the development. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required

to meet needs arising from the development. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement.

Comment summary:

Object to the proposals. The site is prone to surface water flooding and the proposals would exacerbate this problem. Increased traffic congestion. Increased pressure on local services and infrastructure, including local schools and health centres. There has been insufficient consultation on the proposals. The site is arable land which could be home to wildlife and birdlife. The area has already been over-developed and the development would ruin the character of this traditional North Yorkshire fishing village. Brownfield sites should be prioritised over greenfield sites in accordance with the NPPF and the Council's own draft plan.

Officer response:

The site lies within Flood Zone 1 of the Environment Agency's Flood Zone Maps, which indicates that the site is at low risk from flooding from main rivers or the sea. In terms of surface water flooding, small areas of the site are at risk, particularly the westernmost part, as shown on the Areas Susceptible to Surface Water Flooding Maps. As for groundwater flooding, the British Geological Survey has produced maps which show the areas that are susceptible to groundwater flooding. These maps show where there is the potential for groundwater flooding on this site. The maps identify four categories of susceptibility. Marske is identified in category 'A', which means there is potential for groundwater flooding to occur at the surface, based on rock type and the estimated groundwater level during periods of extended intense rainfall. However, this does not mean that groundwater flooding will take place as the maps do not contain information on how often flooding is likely to occur (the probability or return period) or to what depth, but just that the physical setting is such that it could occur. The site layout will be expected to direct development away from the areas most at risk and appropriate mitigation measures will be required to reduce all forms of flood risk across the site. A Flood Risk Assessment will be required at the planning application stage and this will need to show that not only can flood risk be mitigated on site (from surface water and groundwater flooding) but that flood risk will not increase the surface water or groundwater flood risk elsewhere. To achieve this, any existing flow paths will need to be maintained. The site is greenfield so sustainable urban drainage systems (SUDS) will need to be used to ensure runoff does not increase. Also any subterranean development would need to be resilient to groundwater flooding, and not disrupt existing groundwater flow paths. Opportunities to improve flood risk in this area of Marske will be sought where possible. The policy already recognises the drainage issues on the site and indicates that these must be resolved to enable the development to take place. This site was chosen due to its sustainable location alongside the Saltburn to Darlington railway line, with access to two railway stations, and its relatively close proximity to services and facilities, which minimises the need to travel and the distance travelled. A Transport Assessment has been undertaken as part of the planning process to consider the potential impact of the development upon the road network. The impacts identified are considered to be acceptable, subject to some access and junction improvements. Furthermore, the Highways Agency have not raised any objections to the proposals with regard to their impact upon the Strategic Road Network. Policy TA2 includes the requirement for any development proposals to be supported by a Travel Plan, to consider and include measures to encourage the use of sustainable modes of transport. A new pedestrian access will be provided between the development and the existing settlement. The Council does not support any alterations to the existing two-way traffic flow under the railway bridge on the A1085. The policy already indicates that contributions will be required, as necessary, at the time of the application towards any services and community infrastructure enhancements required

to meet needs arising from the development. The primary school projections show that there will be sufficient surplus capacity within the existing primary schools in Marske and New Marske to accommodate the demand for additional places over at least the short to medium term. The policy also indicates that provision of a new primary school can be achieved on the site to meet longer term needs. It is understood that Bydales School will have sufficient surplus capacity to accommodate the increased demand for secondary school places throughout the course of the development. The Council expects developers to carry out a genuine and meaningful consultation with local residents, interest groups and recommended/statutory consultees at an early stage, as set out within the Council's adopted Statement of Community Involvement. However, there is no legal obligation for a developer to undertake pre-application consultation and it can only be encouraged by the Council. We have undertaken a 6 week consultation on the draft Local Plan. Throughout the consultation period we held a number of drop-in sessions throughout the Borough, including in Marske, where people could discuss the Plan with Council officers. The consultation and drop-in events were advertised on the Council's website, resident's magazine and notification sent to those on our consultation database. The Council will also hold a 6 week consultation on the Publication draft of the Local Plan. Notification will be sent to those on our consultation database to inform them of the consultation, including anyone who has commented on the draft Local Plan. All of our consultation procedures are set out in the adopted Statement of Community Involvement. In accordance with Policy N4 of the Local Plan, and other relevant legislation, impacts on biodiversity and geodiversity, including species and habitats, will be considered as part of any planning application to ensure detrimental impacts are avoided. The policy seeks to deliver a strategic housing site for up to approximately 1,000 dwellings, supporting community facilities, infrastructure and public open space. The Policy does not propose a hotel, pub/restaurant, drive-through restaurant or petrol filling station. The policy already indicates that the development will be expected to be a well-designed and co-ordinated development which successfully integrates land uses within and adjacent to the site and creates a safe and high quality living environment, taking into account the impact of the development on the landscape. The policy will also be amended to make reference to settlement character. Through good design, it is anticipated that the development can be made to complement the existing settlement. The Council has prioritised the allocation of previously developed land for development. However, as there is an insufficient supply of previously developed land which is suitable or viable for residential development, it has been necessary to allocate some greenfield sites in order to meet identified housing needs.
